Popular Types.

A WEEK-END on the roads, at any time of the year, is sufficient to demonstrate the extraordinary popularity of the family sidecar. Perhaps no form of motoring appeals so much to the average man as this means by which he can convey his wife and children to the sea, to visit friends, or for a day's outing in the country for a very moderate sum.

It is not only the big twin that is suitable for such work—indeed, a very large proportion of the family outfits to be seen on our roads is propelled by sturdy singles. As a passenger-carrier the motor cycle and sidecar is capable of accommodating more persons than many small cars, and though the outfit may have been designed for two persons only, it is now no uncommon sight to see *pater familias* with his eldest on a pillion, while his wife and one or two of the younger members of the family occupy the sidecar with a pile of luggage on the sidecar carrier.

With such usages in view it behoves the manufacturer to construct stoutly, and this he almost invariably does, with the result that the solo enthusiast has a legitimate grumble.

No one wishes to carry about unnecessary weight with its consequences of loss of "life" and increased upkeep, and there is little point in paying twenty pounds for a three-speed gear box if all but the most freakish hills can be climbed on top gear. What then is the solution to the problem? Either manufacturers must make two distinct types, one for solo and one for passenger work, or one of the two most popular forms of motor cycling will have to suffer. In this connection the question arises as to whether there is a really important market for a dual purpose machine. If not, there would still be two main outlets: (1) the purely solo mount which would be lighter, handier, cheaper, and more lively; and (2) the purely passenger machine which would probably develop into something rather more mechanical and less likely to "lean" than the present dual purpose outfit.

An Alternative Fuel.

"THE price of an article is what it will fetch." This being the sentiment in the minds of those who control the life blood of the motor industry, it is obviously a duty to help forward the production of an alternative fuel. Now there are already three alternatives which only require development in order to lower the price of fuel and the consequent cost of road transport in general.

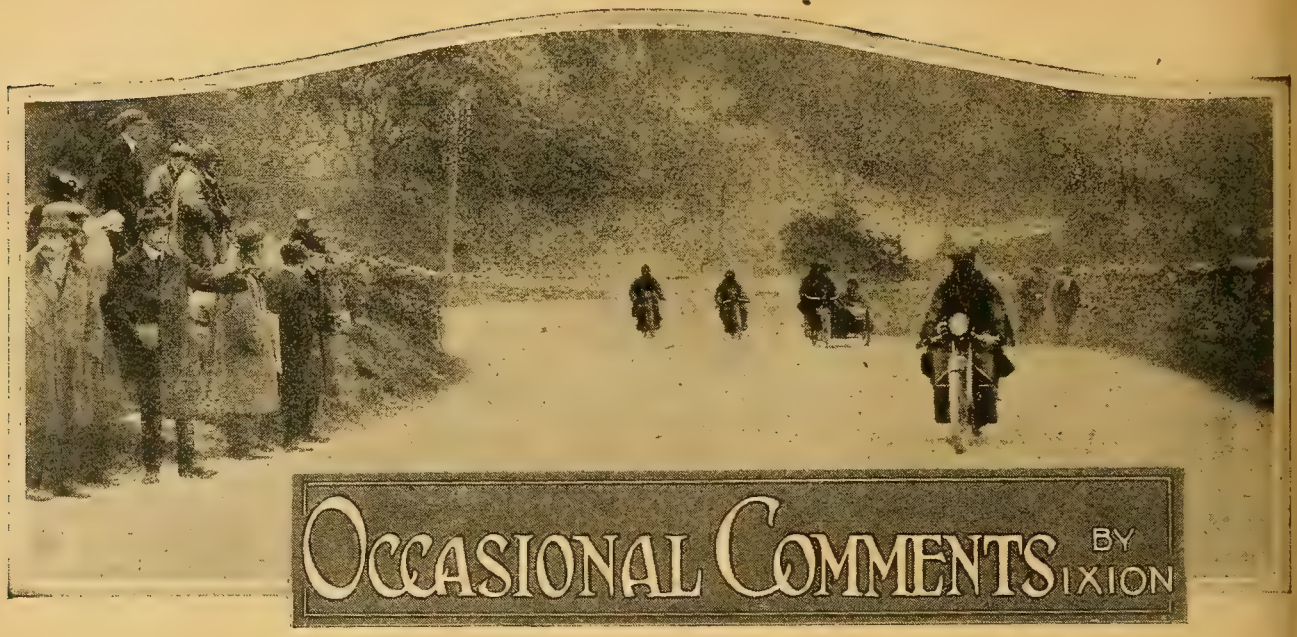
Benzole we most of us know and appreciate, but owing to the claims of the dye industry and the lack of Government support, its price is roughly that of petrol, and it has become very scarce. Shale oil again is an excellent substitute, and enormous shale deposits exist in this country, though they require development.

Alcohol can be produced at home and in so many parts of the world that its supply could be unlimited. An authority on the subject assures *The Autocar* that enough raw material for the production of 50,000,000 gallons of power alcohol per annum can be grown in Fiji alone. There are shipping and distribution difficulties, it is true, but these are not insuperable, and the one and only real cause of the hold up is Government opposition to the use of this fuel. Since the motor industry finds employment for hundreds of thousands of workpeople, antiquated restrictions should surely be banished to allow of its development.

Moreover, the price of motor fuel is not a matter affecting only the private owner, it is a national question which has a considerable bearing on the price of all road-borne freight, both human and commercial, and added to this fuel is of vital importance to the country in the event of war.

It is, therefore, the Government's business to secure an adequate supply of fuel at a reasonable price and this without delay. Every motor cyclist, and indeed every patriotic citizen, should use his utmost influence to secure this end.

An index to the advertisements in this issue will be found on the page facing the back cover.



OCCASIONAL COMMENTS BY IXION

It Doesn't Rust.

I NEVER like eating my words twice over. I know they say the man who never makes mistakes never makes anything, and that if you do not occasionally change your mind, you will never change anything. Still, it does not feel nice; however, here goes. Some months ago I implored the trade to utilise the Kynoch lightning fastener for motor cycling leggings. Some joker informed me that he had done so years ago, and the metal seams rusted up so that he had to be extricated with a tin-opener. I withdrew my pleadings. Then Hamel's of Tamworth told me they had started to manufacture such leggings, protecting the seam with a fabric flap, though their experience was that it throve on water. I got a sample fastener, and it has now lain on my desk for some while immersed in a jampot full of water. I do not know whether the modern edition of the fastener is coslettised, but anyhow it cannot be induced to rust; and readers may confidently buy them without adding a hacksaw to their toolkit.

Coil v. Leaf Springs.

HOW many riders have spotted the rapid stampede towards leaf springs? I well remember the day when there wasn't a motor cycle on the road that had a leaf spring in its anatomy. To-day, perhaps inspired by other people's successes, all the designers are recanting their old heresies, and dropping the coiled spring in favour of the pack of leaves. There is, of course, ample technical justification for the change of practice. In a coiled spring there is next to nothing to damp the rebound, whereas friction steadies the action of the leaf pattern, and so minimises the tendency to bounce. Leaf springing for motor cycles is now guarded by a perfect encyclopædia of patents, and the late comers will have to pay royalties if they are not careful. Still, I note that a few wizards have the necessary cunning to devise dampers for the coiled spring—witness G. E. Stanley's cute little fitting on the latest Triumph fork. Those makers who cling to undamped coil springs should have lined the road between the top of Keighley Gate and Harden Bank in the A.C.U. days. The sound of clashing forks drowned the burr of a cool hundred exhausts. Some riders merely said "Ouch!" Others had apparently served as sergeant-majors.

The Alternative to a Spring Frame?

"THERE isn't one," would have been my swift answer to such a query not many moons back. But, as I mellow with age, an increasing reluctance to dogmatise besets me, and there are times when I wonder if, perhaps, Lenin himself isn't, after all, quite a decent fellow, and fond of nursing babies when he isn't busy exterminating the bourgeois. So I won't pretend that one or two firms have not developed very threatening substitutes for a spring frame. To-day, for example, I have been perturbing the ozone on a 1920 Scott. The Scott fork has always been deservedly famous amongst the small coterie of forks which rank as absolutely first-class. The firm are wise enough to fit a super-saddle. The footboards are sprung. The tyres were 3in Palmer cords. Vibration—well, most men know that when one cylinder of a Scott has gone dud and the other is sixteen stroking, the engine is less feelable than some four-strokes are when they are tuned up for the managing director's wife to take a trial run. So you can guess that there was not a hair's breadth between this outfit and the best spring frame I have tried in respect of comfort. I am told, too, that the new little flat twin Zenith with the special saddle suspension transports its rider along a graph resembling a horizontal straight line, leaving the machine to outline the pits and steeples of which the average road surface is now composed. So long as we get the 1926 standard of feather-bed travel, we do not much mind whether it is furnished by a spring frame or a set of ingenious detail gadgets giving the same effect.

Tyre Repairs.

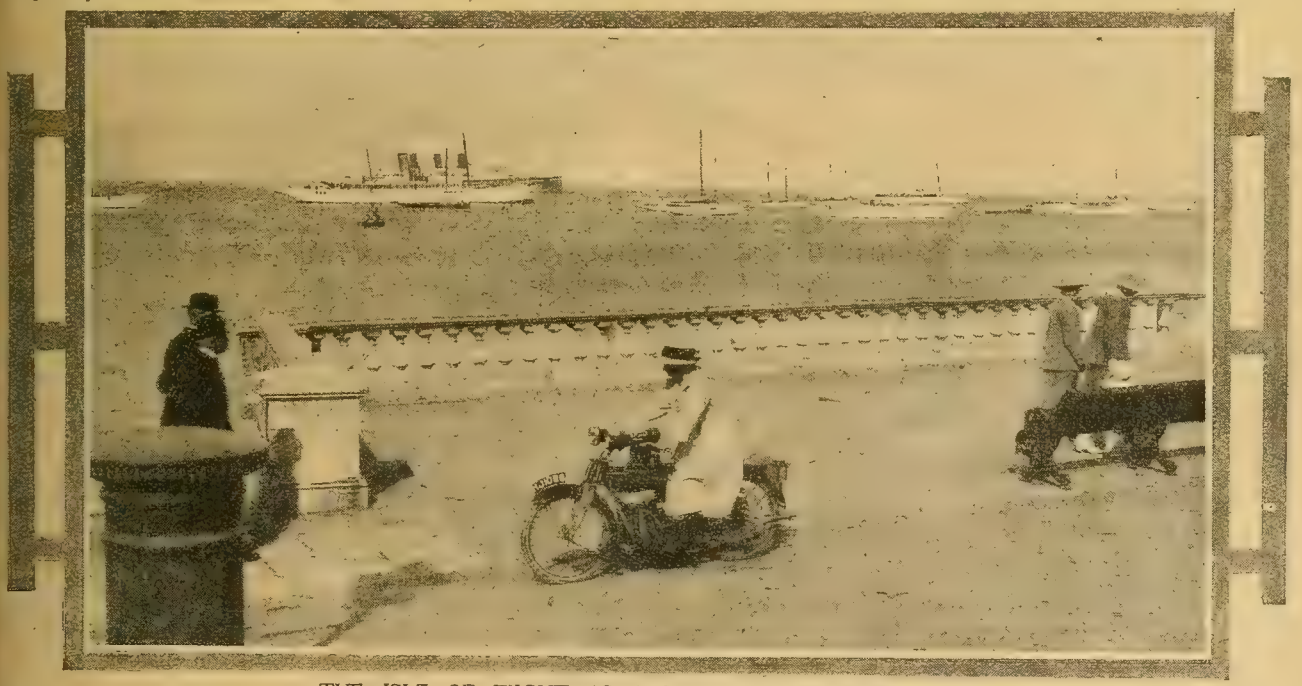
LAST week a friend started to ride 300 miles with me. His 'bus was very fast, very heavy, and very old. He could not be worried to take any spares. It was—to my mind—a toss up whether the chains or the tyres stopped him. It came up tyres. Puncture No. 1 was only a pinhole, but it penetrated exactly outside the edge of an old patch. Should he strip the old patch or not? The day was hot and we were a shade behind time, so patch No. 2 was a semi-eclipse of patch No. 1. It lasted better than we had a right to expect, for it was eighty miles on when a speedburst led to a fearful wobble and hasty stop on his part. He exposed a foot of tube, peeled off patch No. 2, and put on another very carefully. After five minutes' rapid fire with one of those silly little vest-pocket inflators which are often supplied with big machines, he sulkily freed the whole edge of the cover, to discover that the cover had crept when the tube deflated and that six inches of the tube were tattered and the valve clean adrift. At this point the enormity of touring without tyre spares became apparent. The scene was five miles from a small Yorkshire town, and though I happened to be at hand to fetch supplies, it was 100 to 1 against a wee burg having an unusual size in stock. I went back and after some search unearthed a pre-war butt-ender of inferior make. It lasted fourteen miles, to judge from the wire which followed me to our common destination in lieu of my pal.

The Umbrella Coat.

I WAS never a dude, as my intimate acquaintances will bear witness, but the exigencies of motor cycling in bad weather have led me to take keen interest in my attire of late years, and I am urged by one or two readers to make public enquiry whether anybody still manufactures the "umbrella" coat, and eke whether black rubberised waterproofs of stout texture are still obtainable? For those who have forgotten the umbrella coat, let me explain that it was certainly the goods for one-season wear. In lieu of an ordinary collar, it had a poncho-type hole at the neck; this hole was lined with elastic rubber, and cut a size smaller than the rider's neck. To enter the coat, you splayed the hole with both hands, and finally emerged rosy, dishevelled, minus spectacles (if worn), ears, face powder and pomade hongroise; the elastic collar then contracted around your neck, and effectually sealed it against the ingress of rain. Towards the end of the season the rubber neck began to get slightly chafed, and you began to adorn it with patchquicks in increasing number and variety; these had a bizarre but wholly decorative effect on the black collar. Next season you, of course, bought a new coat. In spite of these handicaps, the umbrella coat was easily "it" for long distance work in the rain. The indignity of entering it, and still worse of leaving it, was easily balanced by the absence of that usual shuddery stream of cold water running down one's back. Are these coats still procurable?

Parsons Chains in the Six Days.

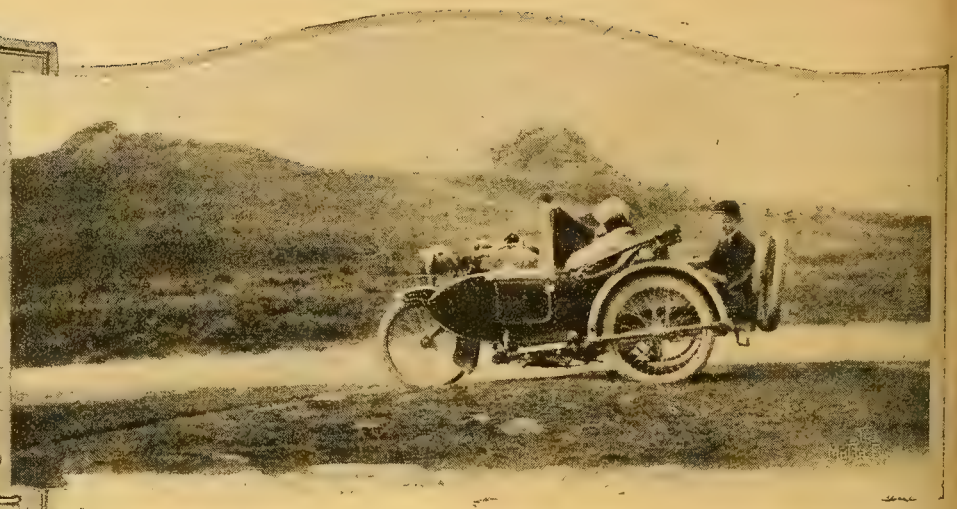
FOR many years past Parsons chains have been recognised as the motorist's one salvation in peculiar circumstances, such as driving on wet ice, or extricating a car from a sodden field after a steeplechase. For such reasons many car owners make a point of carrying them in their tool lockers, but I had never until 1920 met an owner who found it necessary to keep them fitted throughout a tour. The incredibly atrocious character of certain roads included in the A.C.U. Trials is well shown by the fact that the Morgans wore Parsons chains on their rear wheels throughout.



THE ISLE OF WIGHT AS A MOTOR CYCLING GROUND.

Although rather circumscribed the island is a delightful place in which to spend a late motor cycle holiday, the scenery being exceptionally varied. The scene, showing an Enfield two-stroke, is outside the club house of the Royal Yacht Squadron. In the distance can be discerned a big surrendered German liner, which was handed over with its machinery workable, but mysteriously inefficient.

SIX MONTHS WITH A FAMILY SIDECAR



ON TOUR.
The Rex with its passengers on Dartmoor, 1,300 feet up.

Being Experiences of 2,500 Miles with an 8 h.p. Rex-Blackburne Outfit.

THERE is a period in the motor cycling career of almost every family motor cyclist when footstool accommodation for the junior member of the party is inadequate and a pillion seat not quite all that is required. A child up to six or seven can be seated snugly at its mother's feet; but in another year or two the child leaves the baby stage and becomes a person of importance, so that the question of accommodation has to be considered.

For Business and Pleasure.

Since the early spring a member of *The Motor Cycle* staff has had in use a Blackburne-engined 8 h.p. Rex, with a large sidecar built to his special requirements including a dickey seat for a boy of eleven. The machine had to be suitable for:

(1.) Duties in connection with editorial work, such as following trials, etc.

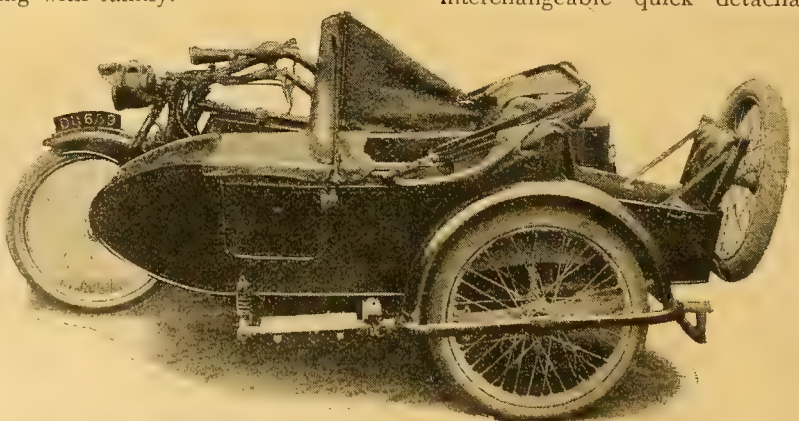
(2.) Pleasure touring with family.

(3.) A combination of the two when circumstances permitted.

How well the big Rex has served these purposes may be judged from the fact that, at the time of writing, over 2,500 miles stand to its credit, fully half of which has been done in wet weather, and on no part of the machine has it been necessary to use a tool, except to change a wheel when a puncture has occurred. Further, the engine and gear box have received no adjustment, and the former has not even been decarbonised.

The machine first appealed to its owner on account of its solid construction, its splendid finish, its large wheels, and its long wheelbase. In the latter connection the desire for a long sidecar was partly responsible, as it was well appreciated that a sidecar to look well with a dickey seat had to be long, and on the average machine such a body as that adopted would look absurd, just as the average sidecar body on the long Rex would not harmonise.

The sidecar was designed and made by the Rex Co., who now have standardised it as their *de luxe* model, and, as will be seen from the illustrations, it is handsome in appearance, while the finish is superior to at least 90% of sidecars made to-day. Those who have inspected the machine agree that this is no exaggeration.



The Rex family sidecar, which has a commodious dickey seat for a juvenile.

A Standard Machine.

The machine itself is the 1920 standard Rex, with adjustable handle-bar, cantilever spring saddle, and interchangeable quick detachable 28 × 3in. wheels.

The engine is the now well-known 8 h.p. Blackburne with outside flywheel, the gear box a Sturmey-Archer, and the transmission is by chain and belt, which latter has not given the trouble prophesied by chain-drive enthusiasts who thought the machine too heavy for this form of final transmission. A post-war belt, however, is quite up to the work, and has only once caused an involuntary stop, when the fastener pulled out through faulty fitting after shortening—an operation only found necessary on two occasions.

During 2,500 miles touring and competition work under all conditions of road and weather, not a nut

Six Months with a Family Sidecar.—

has shaken loose, the sidecar has not required re-aligning, and the clutch has needed no adjustment. In the latter connection, however, it should be mentioned that neglect on this point probably led to the only failure to climb a hill.

This was at the conclusion of the mileage mentioned, and occurred on Dartmoor. Out of Widdecombe-in-the-Moor there is a steep climb in the direction of Bovey Tracy, and it was there that the need of clutch adjustment became apparent, although, strange to say, the same hill was climbed successfully a few days later without any adjustment having been made, which led to the conclusion that the previous failure was due to changing down to first a little too late.

The first run on the machine was a revelation of the advantages of a heavy outside flywheel. With a light passenger in the sidecar, all but the last few yards of Edge Hill were taken on top gear. The owner is still under the impression that the whole climb could have been accomplished on "top," had he known more about the carburetter then fitted.

Then came the Colmore Cup Trial, during which the machine easily climbed Sudeley Hill on second gear. After this trial the routes followed have been forgotten, but there are outstanding memories of journeying to Waddington Fells, in North Lancashire, to attend the hill-climb organised by the Lancashire clubs, of a two-day trip to Chepstow on the occasion of the Birmingham Clubs' Touring Trial, and finally the trip to Liverpool and North Wales two weeks ago for the Reliance Cup Trial. These three trips are remembered for the reason that heavy rain was encountered on each occasion.

Thanks to wide pulley centres, ordinary watersplashes may be taken without trouble from belt slipping.

Belt Drive under Adverse Conditions.

The run to Lancashire for the Waddington Fells event was taken with sidecar and dickey passenger. The hood was up the whole of the way, and for the dickey passenger an additional hood was improvised by fastening an army ground sheet over the hood proper and to the spare wheel.

The drenched roads threw up as much water as came from the skies, and near Weston, Staffs., there were several floods. Notwithstanding, an average of 18 m.p.h. was made, and only after a particularly deep flood was there any sign of belt-slip.

On the Chepstow run the second day was one continuous downpour, yet only very infrequent signs of belt-slip were observed, and during the Liverpool trip, on the 17th inst., the belt did not slip at all.

The comparatively long belt drive is responsible for these good results, as the owner last year ran another chain-cum-belt sidecar twin with a shorter drive, which, under practically identical conditions, was prone to slip.

During the first two weeks of this month a holiday trip was taken to South Devon. The journey of 186 miles was done in the day, with full load and several intervals for sight seeing. The return was made in similar running time. Teignmouth was left at ten o'clock, and detours made to Burnham-on-Sea and the Cheddar Caves. Long stays in these places and in Bristol brought the clock round to 7.30 p.m. before the Western Metropolis was left behind. This meant practically 100 miles in the dark.

The lamp equipment included an F.R.S. Major head lamp and a Motex sidecar lamp, supplied by the F.R.S. generator. For a rear light a Motex lamp and separate generator were used, which gave no trouble and did not require recharging during the six hours run.

During the stay in South Devon several sight-seeing journeys were taken to neighbouring resorts, including several trips on Dartmoor, where it was found dangerous to leave the main roads for apparent short cuts shown on the map.

On one occasion such a nine-mile cross-country run could be likened to the worst section in the hardest trial. With a Gambles Lane steepness and a Park Rash surface, the lanes wandered across the country up and down, but at no time did the engine show signs of distress, although at times the rear wheel sent out showers of stones.

During this first chapter in the life of the big Rex, the impression has been formed that in every way it lives up to the early reputation of its makers, and the only criticisms which can be levelled concern points which have been or are being altered.

In the latter connection, the owner has fitted an aluminium step made by a Coventry firm, and for the convenience of the dickey passenger a small step of the same metal which was supplied by the makers of Rennoc sidecars.

The engine is extremely economical on oil, and with an Amac two-lever carburetter will give 60 m.p.g. under touring conditions.

OVERSEAS SECTION

CAN WORSE ROADS BE TRAVERSED? In the comments on this page it is pointed out that Great Britain contains road difficulties which are as severe as any that can be found in the most remote parts of the world. The moral to be drawn is the futility of designing machines for conditions which are too severe for the riders themselves, and which also tend to improve with the progress of civilisation. The scene above is a typical example of a main road in the Western Scottish Highlands which has suffered a temporary "wash-out."

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

What is Really Wanted?

AMONG the letters we receive a great diversity of opinion is evident as to the ideal specification of machines intended for overseas markets. On the one hand we are requested for the names of lightweights, suitable for use in hot, moderately level, and sandy districts, where cool running, ease of handling, and weight low enough to permit of lifting the machine over the fallen vegetation of the bush, are all advantageous; while on the other hand we are asked to indicate machines of great horse-power, massive construction, adequate springing, light car tyres, and excessive ground clearance.

Sometimes we suspect both classes of correspondents of slightly exaggerating their requirements, much as do the gentlemen at home who hasten into print at frequent intervals with specifications of "my ideal machine."

♔ ♔ ♔

Lessons of the Trials.

DURING 1920 a number of trials have been arranged in the North and West of Yorkshire—these have been both one day events and a Six Days Trial of unusual severity, over tracks laid down in the pioneer days of British commercialism when the water-power of the mountain ranges was an industrial asset. These roads were abandoned almost at their inception, and they now remain, traversed only by the sheep-grazers of a sparsely populated countryside.

Such roads, of appalling roughness, including gradients so steep that the tractive adhesion of even solo back wheels diminishes to such an extent that the torque of a powerful engine is no longer available for propulsion, provide conditions than which none worse could be usefully traversed by means of motor cycles.

Are Worse Roads Rideable?

THE closing words of the last paragraph were written advisedly. Those riders who demand a machine capable of being ridden *anywhere* under *any* conditions, may lose sight of the fact that, long before the limit of the modern machines' range of action is reached, the physical capabilities of the motor cyclist himself are exceeded. In the trial above mentioned almost all classes of solo machines, including some of the smallest lightweights, and most of the passenger outfits, proved themselves capable of negotiating every obstacle, whether it be watersplash, boulder-strewn gulley, or a seemingly endless gradient on the shifting screes of a decaying hillside. The majority of the machines finished without serious breakages. What, then, eliminates competitors from such trials?

♔ ♔ ♔

The Personal Factor.

UNDOUBTEDLY, it is the rider's skill and judgment which now form the determining element in modern reliability trials. Machines will go anywhere where the wheels will grip, but riders may find that a heavy, and powerful machine, plunging from obstacle to obstacle, is almost unmanageable.

If the country which it is proposed to travel contains nothing else but conditions such as those described, it would appear useless to advance the claims of the motor cycle as having greater utility and safety than the horse. Motor cycles are products of civilisation—indeed, one might say they are amongst the luxuries of civilisation, and, rather than retrograde the development of their light, swift, and economical qualities by adding weight, abnormally low gears and tractor back wheels to fit them for conditions not advanced to their era, the adverse conditions should be brought forward to a state consonant with the position which the motor cycle occupies in modern engineering development.

A Selection of Letters from Readers scattered all over the World.

Sidecars for India.

Mr. W. W. DALGARNO, of Cawnpore, states his own requirements for a sidecar to be used in India.

He writes: "The sidecar must have not less than 5in. road clearance, as on the main roads near towns and in the towns bricks on the road are too plentiful. No one would ever shift a brick to the road side. Indians, never; policemen, well they look on and report accidents owing to stray bricks or other obstructions, but move them, never! A policeman would rather see half-a-dozen smashes and walk five miles to report, but rather than move the brick he would resign—that is a coolie's job, not a policeman's.

"I had to cut my sidecar frame to raise it up to clear 4½in. bricks on edge, as I had many jolts. Leaving our main roads, which are splendid, we have ordinary roads, rutted deeply, even a 12in. clearance cannot pass along. Cars for India need 14in. road clearance to be safe on ordinary roads, but, of course, no motor cycle can have that. I have come down with many a frightful jolt on the crank chamber and had the sidecar four times broken (in the luggage carrier part), so sidecar clearance must not be under 5in.

"The rear of the sidecar body should be fitted with clip brackets and straps to carry a spare tyre. 50, 100, 150, and 250 miles without a motor shop is usual, so in India one needs at all times to carry a spare cover; that is where the spare wheel outfit comes in. Our roads seem to be strewn with bullock shoes worn to a razor edge. It is a far too common occurrence to have a cover cut right through and almost right round with a sharp bullock shoe; needless to say a spare cover is absolutely necessary on long runs. Bullock shoe nails are an endless source of punctures and worry to all motor owners. With the temperature at 110-113° F. in the shade it is far beyond a joke; it is dangerous to life to work at a tyre in the sun.

"One more item. The average motor cycle front wheel is not well enough guarded. The wheel throws water and mud, sand and stones into the sidecar passenger's face. *At all times* messes the sidecar body and throws mud on the cycle rider's boots and legs up to the knees. A valance on the mudguard side would save the sidecar from being splashed with sand to the ruination of the paint."

Smaller Jets in Hot Countries.

MR. R. F. MACDONALD, a Swaziland enthusiast, sends a photograph of his Enfield outfit which has 9,000 miles to its credit. So far as the photograph shows the machine is as good as ever. The owner and a friend travelled 500 miles to hear Mr. Harry Lauder in Johannesburg, which reveals a keen admiration for the famous Scotch comedian, and serves to throw light on the conditions of life in Swaziland and the need for a reliable means of transportation such as is afforded by a motor cycle. Regarding the Six Days Trials he says:

"I should like to enter your Six Days Trials. We see many complaints of overheating in your columns. Ownership is rather akin to boastfulness, but I can supply any number of statements in support of my 'boasts,' which may seem rather far fetched. Of the two hills (one on either way out of town), one has a drop of 1,500 feet in five miles; steepest part 1 in 3½. The other seven miles long in landings; steepest grade 1 in 4. Both bad surfaces. I can climb either comfortably three up with an ordinary load of luggage without overheating. The best consumption I have obtained is 90 m.p.g. solo and about 60 m.p.g. with sidecar.

"Curiously enough with my comparatively successful efforts at tune I find it difficult to exceed 35 m.p.h. But I can keep up a 20 m.p.h. average on ordinary Colonial roads for several hours without trouble. In fact, it is difficult to get the machine hot enough for the easiest running in the ordinary course.

"One matter which puzzles me is the large jets in use in the old country. I find 25 very satisfactory; 26 or 27 occasionally for heavier work.

"With the colder atmosphere at home you should have little trouble with overheating. There is absolutely nothing freakish or extraordinary about my 'bus,' and certainly nothing exceptional about my methods of tuning. It is my only hobby, and I am rather a maniac in the pursuit of it. All bearings are perfectly devoid of movement (excepting usual side play). For spares, one cover and tube for rear wheel, and one driving chain, are carried."

British and American Prices.

How the present prices of British machines abroad are causing riders to turn to American productions is illustrated in the following letter from "W.P.H.G." who, from India, writes:

"I wanted a lightweight, but did not want to pay more than £80, so looked around and found a 2½ h.p. Clyno at Rs. 1,000, equalling £100 at present exchange; a Royal Enfield at Rs. 950. I turned away to look at Yankee goods, and bought a Cleveland, Rs. 725, *i.e.*, £72 10s. And much as I would rather have had an English machine I must say that the Cleveland has given me every satisfaction. It is my first American after three English, and the change has shown me many things. Its carburetter is fine; one can start nine times out of ten at first kick; the idling adjustment is what I have been looking for for some time (but few bicycles have the Capac). When the temperature is 106° in the shade, the machine will run mile after mile at 20-25 m.p.h. and never seems to dry up. When will English makers fit lightweights with saddles like the Cleveland? I have not seen one to equal it yet on any other lightweight. But all the same I would not get an American if I could get an English machine at the price to do the same work; but out here it was a case of a Yankee, or a push bicycle.

"When shall we get more motor bicycles out here at a price to fit our pocket?

"I saw an A.B.C. in Lahore, but it was about £200 at the present exchange."

A Dutch Opinion.

Anent the fitting of over-size tyres, MR. A. VAN DER MEE, of The Hague, endorses an opinion recently expressed by a member of *The Motor Cycle* staff. "I see with pleasure that H.D.T. has come to appreciate 3in. tyres," he writes. "Indeed, they are really necessary on bad roads, and on American machines they are standard, even on the little two-strokes.

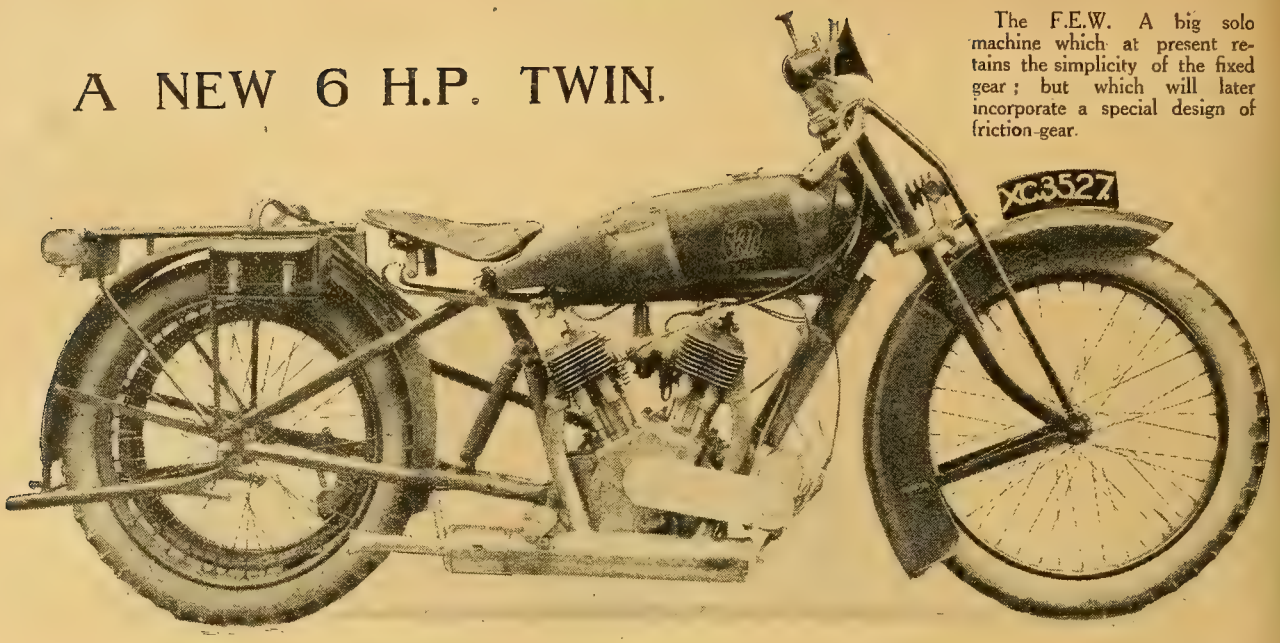
"British roads must still be reasonably good, seeing that some correspondent recommends a foot-operated oil-pump!

"Has any one really appreciated the new Sunbeam forks to the full? The spring-end moves about four times as much as the machine does, giving accordingly a very slow, up and down movement, which distinguishes itself very favourably from the bouncing given by even the best ordinary forks. Practically, as well as theoretically, the forks seem ideal. Now a rear suspension on such lines! Some designers make the movement of the springs far less than that of the wheel, which, of course, is radically wrong.

"Asking for more spring frames, large tyres and smooth running, balanced engines, I wish you every success."

Lieut. Jones, R.A.F., on his Rudge-Multi in Algiers, which he visited with the Fleet during the early part of this year. Mr. Jones states that this was the first motor bicycle seen in the particular district in question. He found progress extremely difficult owing to the extraordinary interest in his machine shown by the natives.

A NEW 6 H.P. TWIN.



The F.E.W. A big solo machine which at present retains the simplicity of the fixed gear; but which will later incorporate a special design of friction-gear.

The F.E.W. Motor Cycle which embodies Several Pleasing Features.

THE F.E.W. motor cycle, illustrated above, has been designed by the inventor of the F.E.W. valve attachment, and incorporates a 6 h.p. J.A.P. engine unit, which is accessibly mounted on four engine plates suspended from the two down tubes.

Triangulated Rear Frame.

At the rear the suspending member is triangularly constructed. The two tubes suspending the engine are bolted to the saddle tube, whilst two similar tubes, brazed to the rear fork, are fixed at the same point. A gear box is not at present fitted, but a novel type of friction gear will be incorporated at a later date.

The petrol and oil tanks are somewhat unconventional. The former, of very large capacity and being of the saddle type, conceals the top tube.

Lubricating oil is carried in a circular tank which is held by clips to the front down tube, and the drip feed lubricator and pump are conveniently located at the top. Saxon spring forks have been fitted for demonstration purposes. A new design, however, will be introduced later on.

Mudguarding has received special attention, and adequate protection at the front and rear is provided.

The silencer and the exhaust pipes have been very neatly designed, and a special fitting is provided whereby the rider may, if required, considerably reduce the noise of the exhaust.

F.E.W. Valve Attachment.

A very comfortable riding position is afforded by the horizontally sprung saddle. This is suspended on two leaf springs anchored beneath the tank, and also on a bracket fixed to the top of the saddle tube.

As may be expected, the F.E.W. valve attachment forms part of the equipment. This valve spring fitting was fully described in the issue of *The Motor Cycle* dated September 18th, 1919.

Novel Tappet Adjustment.

Tappet adjustment is provided at the base of this device, and is regulated by a small disc and locking ring. The standard J.A.P. tappet may also be used; but, it is claimed, a more minute adjustment can be made from the F.E.W. attachment.

The designer, Mr. F. E. Waller, is anxious to place this machine on the market, and is open to negotiate with any manufacturer to whom the design appeals. Mr. Waller's address is c/o Messrs. Rubberine, Ltd., 444, Market Road, Caledonian Road, London, N.17.

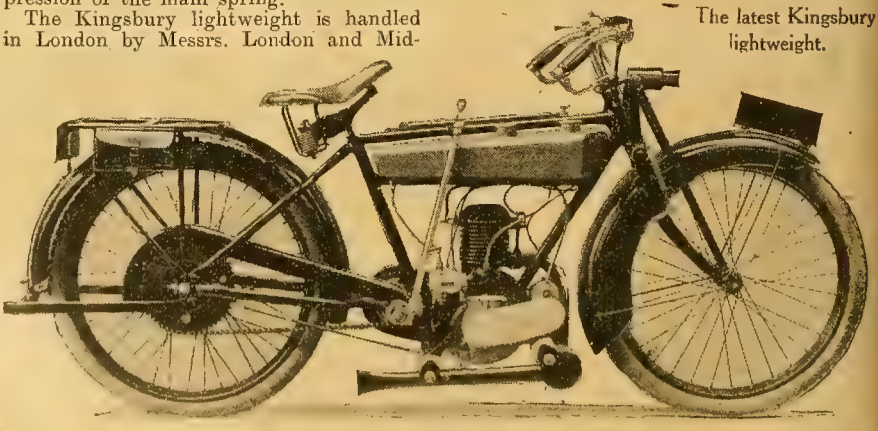
KINGSBURY INNOVATIONS.

WHEN described in *The Motor Cycle* at the end of last year, the Kingsbury two-stroke lightweight was a single-geared machine. Among other improvements, it now embodies a two-speed gear and a new spring fork.

The engine, it may be remembered, has a bore and stroke of 68 and 70 mm. respectively, the capacity therefore being 254 c.c. Plain white metal is used for the big-end and crankshaft bearings. The new gear consists of two floating chain sprockets, driven from two engine sprockets. Between the inner faces of each is a friction disc, mounted on the countershaft, which is closed against the sides of the sprockets by a handle mounted at the side of the tank. The two sprockets provide ratios of approximately 6 and 8 to 1.

A new front spring fork is another feature of the machine, and the design of this component is similar in principle to the well-known Triumph fork. A small recoil spring is located in front of the main spring and absorbs the smaller violent shocks, which occur after the compression of the main spring.

The Kingsbury lightweight is handled in London by Messrs. London and Midland Motors, Ltd., 445, Oxford Street, London, W.1.



The latest Kingsbury lightweight.

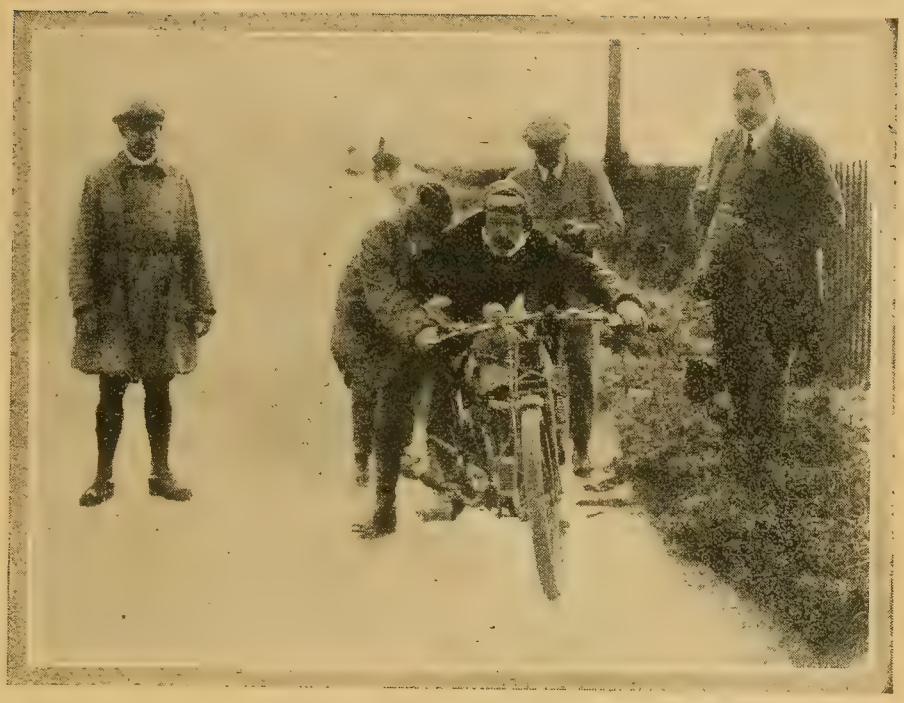
A Wonderful Display of Endurance.

Over 50 m.p.h. for 12 Hours on a 350 c.c. Blackburne.

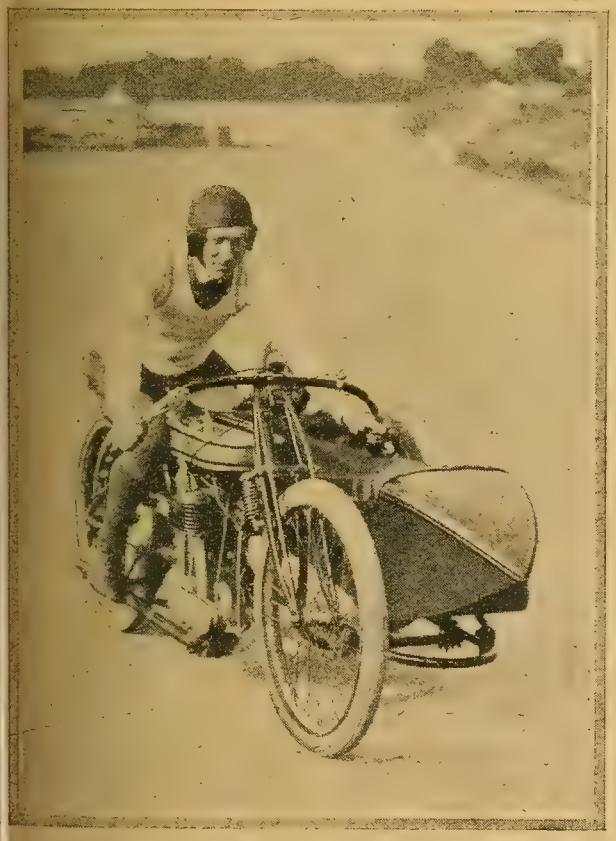
A BIG coup was successfully pulled off by J. S. Holroyd, at Brooklands on Monday last week, when riding a 2¾ h.p. Blackburne motor cycle. He broke all the records in class B for motor cycles not exceeding 350 c.c. which were established, but a month ago, first by F. A. McNab (Wooler), and later by S. Gill on an Alecto two-stroke. He also added figures to these classes for the previously unestablished seven hour and 600 mile records.

600 Miles at 50 m.p.h.

His speeds, which throughout the twelve hours' running, were over 50 m.p.h., extended the nine, ten, eleven, and twelve hour records to classes C, D and E for solo machines not exceeding 500, 750, and 1,000 c.c. respectively. The distance runs from 350 to 600 miles break the records in class B, whilst excluding the 350 and 400 mile records he breaks those in classes C and D, and the 500 and 600 mile records are extended to class E. The 600 mile record in class C was previously unestablished.



J. S. Holroyd (2¾ Blackburne) starting away after a temporary halt for fuel and oil during his 600 mile record run on the track at Brooklands. He averaged over 50 m.p.h. for twelve hours. On the right is Mr. A. V. Ebblewhite, the official timekeeper.



D. R. O'Donovan after creating new speeds in the 500 c.c. and 750 c.c. sidecar classes on a Norton. His time from standing start for the ten miles was 10m. 21⅘s. = 57·89 m.p.h.

It is wonderful testimony to the reliability of the Blackburne that no mechanical trouble was experienced with the machine, which was fitted with short mudguards and a three-speed gear box. A belt fastener, however, pulled out when some short distance from the filling point.

A Clean Engine.

At the conclusion of this splendid performance a remarkable absence of oil on the crank case was evident, and after the strenuous run of 600 miles on a concrete track the condition of the tyres was certainly good. The rear wheel was, however, changed after ten hours' running, as a small nail was located in the cover and might have given trouble. Otherwise there was sufficient rubber to have completed the total distance. It is curious to note the side wear on the tyres which is obviously due to the curve of the banking. Avon tyres and belt. Pratt's spirit, and Wakefield Castrol were used.

His performances were as follows:

TIME RECORDS.

Hours.	Miles.	Yards.	New Speed.	Old Speed.	Classes.
			m.p.h.	m.p.h.	
7	358	688	51.18	—	B.
8	411	1,329	51.47	42.84	B.
9	451	1,207	50.17	42.60	B, C, D, E.
10	504	133	50.40	42.14	B, C, D, E.
11	551	96	50.09	41.78	B, C, D, E.
12	602	658	50.19	41.71	B, C, D, E.

DISTANCE RECORDS.

Miles.	H. M. S.	New Speed.	Old Speed.	Classes.
		m.p.h.	m.p.h.	
350	6 50 30	51.17	42.86	B.
400	7 46 30⅘	51.59	41.09	B.
456	8 58 9	50.17	41.75	B, C, D.
500	9 55 18⅘	50.39	41.71	B, C, D, E.
600	11 57 11⅘	50.19	35.30	B, C, D, E.

Another Norton Success.

A Norton sidecar outfit also figured in Monday's record breaking, and, piloted by D. R. O'Donovan, raised the speed of 56.71 m.p.h., in the ten miles standing start, previously held by J. Cocker (Triumph) in class G for passenger machines not exceeding 500 c.c., to 57.89 m.p.h., and in class H for passenger machines not exceeding 750 c.c. he also raised the old speed of 57.71 created by E. B. Ware on a Zenith-Jap, which has stood since November, 1913. O'Donovan's time over the ten miles was 10m. 21⅘s.

It is interesting to note that all the figures in class G now stand to the credit of either O'Donovan or his partner, H. H. Beech, who are in business in Great Portland Street, London.

IMPRESSIONS of the SCOTTISH "TWO DAYS"

A Competitor's Memories of an Arduous though Sporting Event.

FOR most of us in the North the Scottish Two Days was the last event of importance for the year, and as such it was very appropriate. True the weather on Monday morning, when the choicest scenery was traversed, was not all that it might have been, but in spite of clouds, wet, and chill, one could not pass within the solitary splendour of Glencoe without a sense of its magnitude and grandeur.

Throughout the trial, indeed, one was passing through scene after scene which left one with a feeling of dazed incomprehension, and even back in the din of the Edinburgh streets, the mountains far behind, one was still aware of the spell, and of a sense of having seen something a thousand times worth while.

One comes to understand a little why the people of these hills never tire of their views, but living their lives in what most people would consider absolute loneliness, they love the glens and corries of their birth with a love that passes the understanding of city folk.

Happy Official Rulings.

Riders who have not as yet been so fortunate as to compete in a Scottish Trial have something to which to look forward, for the officials of the Edinburgh Club have attained a happy knack of attuning their events to the country through which they are run; and far from being hampered by an obsession of petty rules, a spirit of freedom and good-fellowship pervades these events in keeping with their more rugged characteristics. The officials are fellow sportsmen, always ready with a word of cheery help and advice, and one feels that they would far rather give one a mark than take one away. As an example—a member of the Cumberland Club forgot on one occasion to check in. He was early at the check, and with several companions went into the hotel for tea. Naturally he lost marks, but at the end of the trial it was decided that, since this was his first trial and he had ridden well otherwise, his omission should be pardoned. Thus the team prize went to the Cumberland Club instead of the Edinburgh Club—an example of sportsmanship and courtesy which gave every concession to the visitor.

One could not make the best of a Scottish Trial with one eye on the watch all the time, and, realising this, the organisers of Scottish events have arrived at a fair and thorough system of marking whereby a competitor need not look at his watch at all if so minded. The official on duty is always ready to tell you the time when you arrive, and I have myself ridden in several Scottish Trials without having a watch in my possession.

Severity.

Now as regards the severity of the event, it can certainly be said that, though a crack rider on a dud machine might have got through, a dud rider on any kind of machine would most assuredly have gone under. The times were not severe so long as one experienced no trouble, but the nature of the roads was such that if delayed the subsequent blind was almost sure to lead to a fall and more delay. It was, more than anything, a test of wheel bearings, mudguard fittings, and frames. The miles of wet sand caused more than one wheel bearing to give out, and how the frames stood the terrific jolting is a marvel. As a matter of fact, all of them did not stand it.

On the outward journey the pot-holes between Edinburgh and Stirling seemed appalling, but returning on Monday evening over the same road it impressed one as being like riding on a billiard table after what we had passed. Personally, I emerged with the utmost respect for the little spring frame mount I was riding, for apart from being a picnic in the way of comfort and speed, it demonstrated its strength by coming unscathed through a crash which might excusably have driven in the front forks. I bounced off the road and the machine crashed nose first into a ditch four feet or so in depth, meeting the perpendicular bank with such force that the little mount bounced back on to the greensward!

There are so many who rode well that it seems hardly fair to mention one or two of one's friends and omit the rest, but I cannot refrain from mentioning the name of J. M. Russell—a comparatively new man to the competition world—who successfully piloted through his little two-speed 2¼ h.p. Levis, climbing all hills with power in hand, and riding to time in

A Competitor's Impressions of the Scottish "Two Days."—

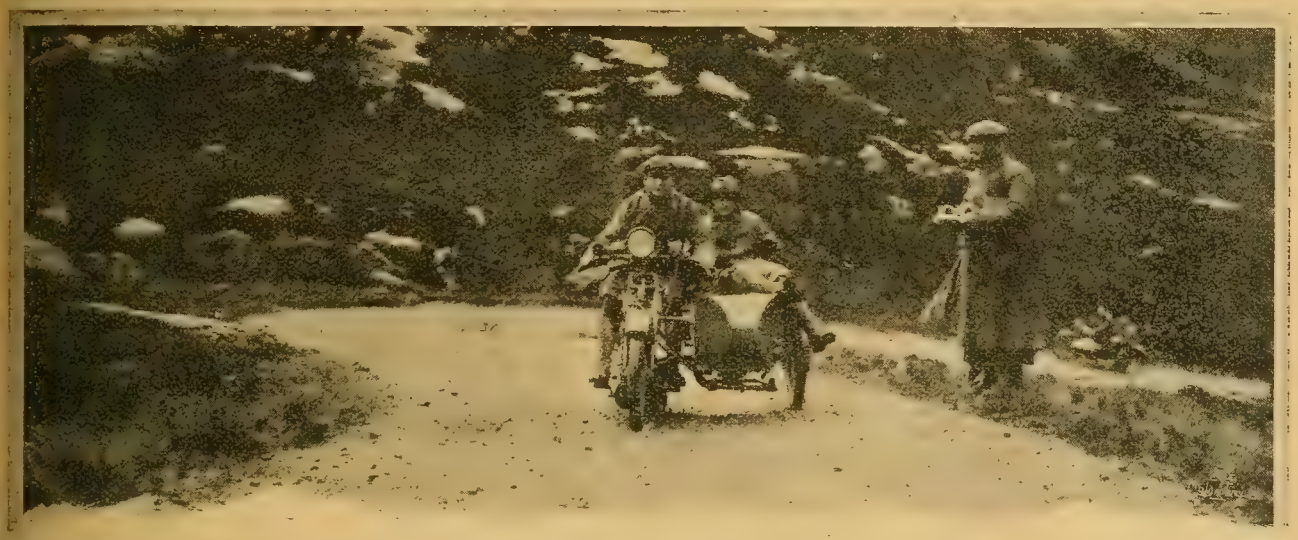
spite of roads and weather. This was no mean proposition, as the task of handling so light a machine over great distances and through such adverse conditions was as severe a test of the rider as it was of the machine.

Youthful Competitors.

Two very juvenile riders, J. Manuel (4 h.p. Triumph) and A. B. Fairley (A.B.C.), came through successfully, for which they are to be congratulated. They were not exceptional in yielding to the temptation to blind when occasionally road and weather relented, for one or two old hands rather set the example in this respect. It would, for instance, be interesting to know the exact riding time occupied in covering the last check of the trial by the respective riders of an Ace, a Harley solo, and a Norton!

And so for most of us, I say that the Scottish Two Days Trial was not remarkable for its freakish severity, but for its genuine and sporting hardships, and we shall remember it rather as a careless holiday affair than as a trial. The hills were fair—a test of efficient cooling and good riding rather than of the ability to adapt freak gears to a given design—and any good amateur stood a reasonable chance of surviving happily. Our Scottish trials are essentially suitable for amateurs, and it is hoped that next year an even greater number of sportsmen will travel northwards across the Tweed to participate in them.

H. MORTIMER BATTEN.



ON A FAMOUS SCOTTISH PASS.

J. Beck (3½ Sunbeam sc.) making a good ascent of Glencoe in the Scottish "Two Days" Trial

The Removal of Superfluous Weight.

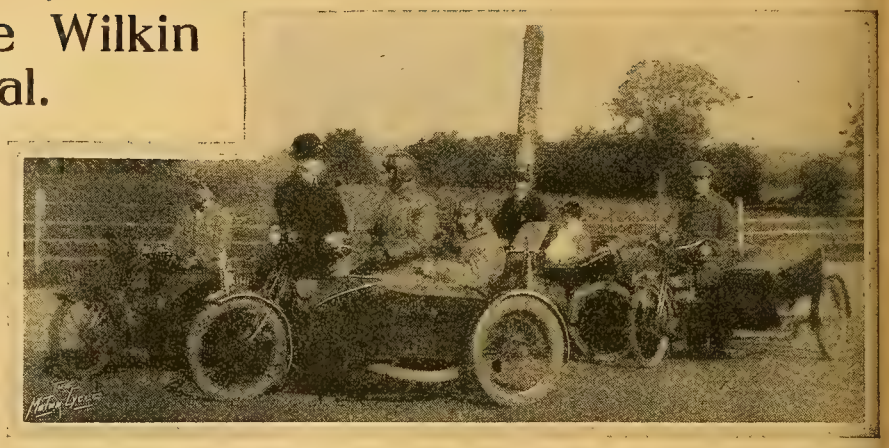
QUITE properly the question of weight is coming in for discussion more than ever before. Whatever may be the contentions of those who prefer to handle heavy machines it must be obvious that we cannot obtain real efficiency without reducing useless weight to a minimum. Weight, therefore, should depend on h.p., and weight horse-power ratio is the thing that counts. Therefore, it seems reasonable that in future days when we are getting nearer to engineering ideals, the man who likes to handle a heavy machine will be able to obtain it only combined with high power.

By all means let us reduce the weight of our motor cycles, but unless this is done in a thorough and scientific manner we shall not only save but a pound or two, but we shall introduce fresh troubles due to weakened parts.

Unfortunately, weight paring does not always go hand in hand with production methods, and to remove an appreciable poundage from an existing model would be a costly and laborious process. To avoid this the designer must lay out his new models with the lesson of the Dreadnought before him, and his weight-saving must be done in so far as is possible without increasing production costs. Details must be considered, as it is here that substantial reductions can be made.

Reasonable reduction in the weight of reciprocating parts, far from being dangerous, will lead to greater reliability owing to decreased inertia stresses, added to which a corresponding weight is saved in the balance weights. Much weight may be saved by the employment of an outside flywheel. Plain bearings are lighter than ball-races, and, provided they are designed for the loading they will receive, and properly lubricated, they will wear excellently. It is a waste to use a gear box designed for a 4 h.p. single on a 2¾ twin, and nuts and bolts are often out of all proportion to the work that they are required to do. Much weight could be saved by the standardisation of accessories, so that lamp brackets, etc., could be incorporated in the handle-bar or frame fittings, and the same applies to speedometer fittings, tool bags, generator fittings, control levers, etc. It is quite instructive to examine the machines of casual tourists and to count the various clip attachments which may amount to as many as sixteen to twenty, all of which add weight which could easily be saved by design.

Progress of the Wilkin Coast Trial.



The worst over. The Wilkin outfit at Grimsby after having covered half the distance planned for the Coast Trial.

"WE have had no mechanical trouble and the machine is running as sweetly as when we started fourteen days ago," said Mr. J. W. Wilkin who with Mr. Barr, the A.C.U. official observer as passenger, is piloting a 4 h.p. Blackburne engined Wilkin and sidecar round the coast of Great Britain, to a representative of *The Motor Cycle* in an interview at Chatham, on Wednesday, September 22nd.

The Wilkin is the first motor cycle to undertake a unique trial of this kind under official observation. The route has been mostly over unbeaten by-ways in order strictly to carry out the programme to the letter, *i.e.*, to tour as near to the sea as possible all the time.

Unfavourable Weather Conditions.

When we saw the outfit at Chatham, it had been on the road thirteen days, and most of the time it had been a battle against tempestuous winds and rain, such as are only experienced on the mountain tracks of Scotland at this time of the year.

The total distance of 3,500 miles which the driver was still confident he could complete without mishap, was hoped to be covered in twenty days. The fact, however, that a strong headwind had opposed the riders the whole time would in all probability lengthen the period slightly. Exceptionally difficult roads and rough mountain tracks, which, as indicated by signposts, were closed to motor traffic, were encountered between Stranraer and Ballantrae, situated on each side of Loch Ryan, on the west coast of Scotland, and though such conditions were quite unexpected, the frame and sidecar chassis survived the experience. The famous Rest-and-be-Thankful hill was included in the route, and climbed successfully.

Another exceptional test of durability was demonstrated on the "road" from Garelochhead to Inveraray. Mud, inches deep, was traversed, and at times the bottom of the crank case scraped along hard surfaces beneath the mire. At one point on this road, the machine had to be driven down hill on bottom gear, in order to overcome the resistance of the mud.

The gear ratios on this machine are 5¼, 9.4, and 17 to 1, whilst the all-chain drive is, in the rider's opinion, the chief reason for his non-stop success, as he considers a belt would have been impossible in the torrents of rain encountered. The fuel and oil consumption, Mr. Barr informed us, has worked out at approximately 68 m.p.g. of petrol, and 800 m.p.g. of oil.

The Equipment Carried.

The only adjustments that had been made up to the time of our interview were occasional shortening of the chains, and one changed cover on the rear wheel of the machine. The cover on this wheel burst when negotiating a road strewn with large flint boulders.

As far as riding equipment is concerned, the driver has found that there is nothing to beat the oilskin waders similar to fishermen's boots, and a large and roomy oilskin coat, beneath which may be worn numerous other garments of a woolly nature in order to keep the circulation good.

Very few spares have been carried, such things as valve springs and spare valves only being deemed necessary.

The route to be covered to complete the journey embraces most of the southern seaside resorts, and with Land's End as the turning point, the riders planned to proceed through Bristol, *via* Porlock and Lynton, then around the Welsh coast to Liverpool.

It will be noted from the schedule below that there are still 1,084 miles to complete the test.

The Coast Ride Schedule.

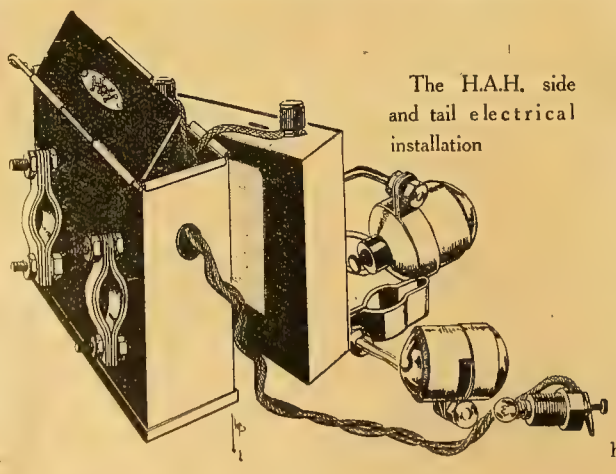
Towns	Mileage.	Total.
Liverpool	—	—
Carlisle	188	188
Glasgow	224	412
Fort Augustus	180	592
Thurso	240	832
Banff	202	1,034
Edinburgh	224	1,258
Whitby	200	1,458
Hunstanton	192	1,650
Chatham	212	1,862
Southampton	204	2,066
Plymouth	192	2,158
Barnstaple	200	2,358
Cardiff	184	2,542
Aberystwyth	204	2,746
Liverpool	200	2,946

ELECTRIC LIGHTING FOR SIDECARS.

IF a motor cyclist does not desire to go in for the expense of a dynamo lighting installation for his motor bicycle and sidecar, he will, doubtless, be relieved to hear of a reliable means of lighting his side and tail lamps by electricity, thus saving the complication of an extra generator.

Aluminium Castings.

Messrs. A. H. Hunt, Ltd., H.A.H. Works, Tunstall Road, East Croydon, Surrey, have placed upon the market a very neat battery set comprising the well-known Hellesen battery, which is extremely reliable and has great lasting powers. The lamps are aluminium castings made throughout by the firm at their new works at Croydon, and in design both side and tail lamps are practically identical.



The H.A.H. side and tail electrical installation

An Ingenious Sidecar Bracket.

In our illustration the tail lamp is shown with the bulb removed, showing the bulb-holder and the neat screw-switch and locking device at the rear. The sidecar lamp is provided with a simple and ingenious bracket, which enables it to be attached either to the sidecar body in a horizontal position or upright in the centre of the sidecar wing.

The whole installation is particularly well carried out, and the lamps and battery box are well finished and strongly constructed.

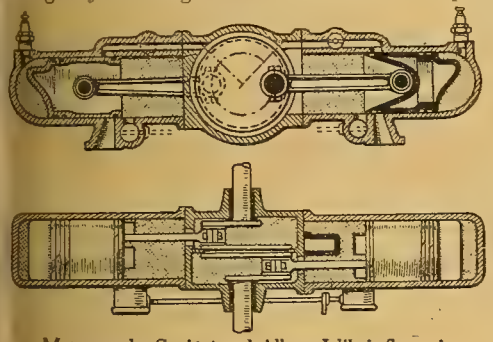
This outfit could be fitted by the average rider himself in under half-an-hour.

SOME RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

Latest Details in Design, as revealed by the Patent Files.

THERE is a "certain liveliness," as the war *communiqués* used to say, in the petrol engine world. Designers do not believe that we have approached finality, and the hopes of inventors run especially high where two-strokes are concerned. The first patent in the present batch relates to a proposed Motosacoche flat twin two-stroke, and is phrased to cover four, six, or more cylinders of the h.o. type. Its salient features include the use of a two compartment pump, and a system of introducing a cushion of pure air into the cylinders just ahead of the combustible charge. This advance guard of air serves many purposes. It cools and scavenges the cylinders, it reduces or prevents waste of petrol through part of each fresh charge escaping unburnt with the exhaust, and it avoids fouling of the fresh charge by "mixing" with the exhaust.



Motosacoche Société and Albert Islikei, flat twin two-stroke. No. 128,560. 14/6/19.

These advantages are obtained by a special arrangement of the interior spaces of the engine and of the ports, which is very complicated to describe on paper, but entails no extra working parts, is quite cheap and simple to construct, and appears to be thoroughly sound and practicable. In fact, if the inventors can find a magneto which gives two absolutely simultaneous sparks in a satisfactory manner, we should hear a good deal of this engine in days to come. The interior space of the engine is divided into six compartments, viz.:

(a) The two usual combustion chambers.

(b) A chamber on the underside of each piston, separated from the crank case by a partition, in which there is an opening to clear the connecting rod.

(c) Two chambers in the crank case, each crank revolving in its own compartment.

Before proceeding further, it must be understood that the chamber below the left-hand piston is the *gas pump*, and can be connected by ports to the inlet pipe and carburetter. Its connecting rod opening further couples it to the top half of the crank case (as shown in the sketch), from which gas transfer pipes lead to the gas transfer ports of both cylinders. Note further that this pump space is large, whilst the carburetter has a small choke tube and is set to give a rich mixture.

By contrast, the chamber beneath the right-hand piston is artificially restricted in area by means of a cone-shaped cap beneath the piston, and also by a projection mounted on the web between the chamber and the crank case. This right-hand chamber is the *air pump*. It can be connected by ports to a pipe opening into the atmosphere. Its connecting rod opening further couples it to the bottom half of the crank case, as shown in the sketch, from which special air transfer pipes lead to special air transfer ports in both cylinders. The free space of this air pump is much smaller than that of the gas pump on the opposite side of the engine.

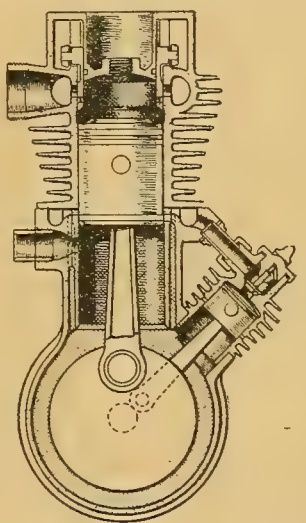
The cycle may now be traced. Begin with the simultaneous outward stroke of both pistons. The gas in the combustion chambers is compressed, a partial vacuum is created in the chambers beneath both pistons, and the inlet ports are then uncovered. Gas is drawn into the gas pump, but, owing to deliberate throttling of the carburetter induction system, the gas pump cannot fill itself right up with rich mixture. The air pump is much more powerful. It draws so fiercely at the air intake pipe as to charge itself fully, and air is drawn into the air transfer pipes. These air transfer pipes communicate with the gas transfer pipes through the openings just outside the transfer ports which connect the gas transfer pipes to the air transfer pipes, so that all four transfer pipes now contain pure air.

Induction and Scavenging.

The explosion then occurs, and the compression strokes of both pumps commence. Here, again, superior pressure is created in the right-hand pump, just as heavier suction was created in it during the outward strokes of the pistons. A further volume of air is forced up the air transfer pipes and through the connecting orifices into the gas transfer pipes. Thus a cushion of air is interposed in the heads of the gas transfer pipes, between the transfer ports, and the charge of rich mixture now under compression in the gas pump. Finally, the transfer ports open, and both pumps feed air into both combustion chambers during the initial portion of the transfer period. A moment later the gas transfer ports commence to feed rich mixture, whilst the air transfer ports continue to fed pure air. But the exhaust is now being pushed out by the advance guard consisting of pure air. Waste of fuel is avoided, and the fresh charge runs small risk of contamination.

The most cunning detail of the engine is the interconnecting of the air transfer and gas transfer pipes, enabling the superior pressure of the air pump to put what a gardener might call a "top dressing" of pure air on the gas charge.

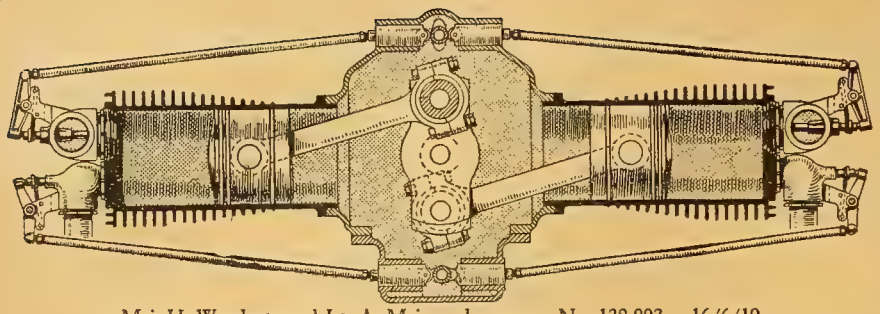
Control valves are located in the gas and air intake pipes, and provision is made for cutting out the right-hand combustion chamber when low road speeds are desired. This is done by an auxiliary throttle controlling both the transfer pipes of the right-hand cylinder.



W. F. Lechmere's two-stroke. No. 138,700. 7/2/19.

Two-stroke with Pump Cylinder.

Mr. W. F. Lechmere's engine aims at very similar results, but pursues them by a different method. He complicates his engine by the addition of a separate pumping cylinder. The extra cost and complication may be justified by the improved charging and heavier crank case compression thus obtained. As the drawing shows, an exhaust valve of the sleeve type is mounted in the cylinder head and operated by a circular cam path machined on a pushrod driven off the timing gear in the crank case. When the sleeve is lifted by the cam path and cam levers, the exhaust ports are opened. (A poppet exhaust valve may be substituted, if preferred.) The small pumping cylinder on the right serves a dual purpose. On the up stroke the lower side of its piston reinforces the crank case vacuum, and helps the main piston to draw in a good charge of rich mixture from the carburetter.



Maj. H. Woodgate and Lt. A. Main, valve gear. No. 138,803. 16/6/19.

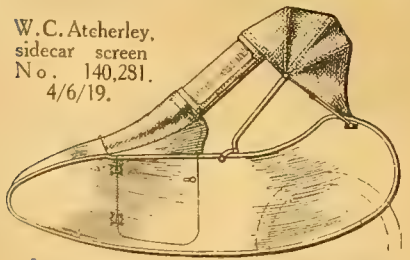
Similarly, on the down stroke, it aids the main piston to drive the charge up the transfer passage. The upper side of the pump piston draws in pure air on its down stroke, and on its up stroke it forces this air past a non-return valve into an annular chamber provided round the main cylinder, and opening into that cylinder through special air ports. These air ports are uncovered by the piston just before the transfer ports come into action, and just before the exhaust valve is closed. Thus, scavenging of the exhaust gases is assisted by compressed air, and, as in the Motosacoche design, the new charge is "top dressed" with pure air to prevent contamination. So long as simplicity and cheapness of manufacture remain dominant factors of the commercial two-stroke, a single-cylinder pattern which requires two pistons, two cylinders, and a timing gear, must be rather handicapped.

An Unconventional Engine.

An unusual type of valve gear follows. I am not quite sure what is at the back of the minds of Maj. Woodgate and Lt. Main, who protect a valve gear for a flat twin four-stroke in which both cylinders fire simultaneously. Thus, a single two-pointed cam opens the inlet valves of both cylinders by means of piston-type tappets, pushrods, and levers, whilst a similar cam operates the exhaust valves, of which there are two per cylinder.

Protection for the Passenger.

Mr. Atcherley's sidecar inspires musings on the strength of calf love. Picture the outfit on Dartmoor in a blizzard. In the sidecar is a sweet young thing, looking too dinky in a mauve jumper, snug, dry, and sucking chocolates. On the saddle, exposed to the fury of the elements, sodden, frozen, with chattering teeth, is a mere male, chivalrously rejoicing at the thought that his beloved is so comfortable, quite

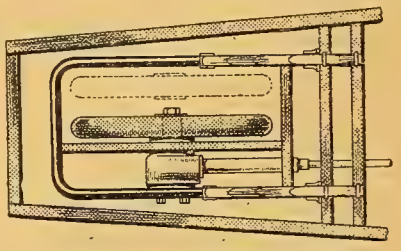


W.C. Atcherley, sidecar screen No. 140,281. 4/6/19.

ready to perish at her side, not asking for a word of conversation, and aware that she is too completely enclosed to pass him one of those nasty, hard chocolates put at the bottom of a box to make up weight, and which the more selfish types of joy-girl usually reserve for their swains. When I reflect on the whims of the British climate and the growing demand for such complete sidecar protection as Mr Atcherley offers, I cannot but think that the cycle car will ultimately knock the sidecar out. Personally, I have done with calf love, and the contrast in comfort which this sketch suggests rouses me to selfish fury.

A Detachable Rear Wheel.

Messrs. Baron and Matthews provide an alternative method of dismounting the rear wheel of any three-wheel chassis. The tail of the frame, be it rigid, main frame, or sprung sub-frame, consists of what an ex-R.A.F. man would term three *longerons*, instead of the usual two. The rear wheel is carried between the central *longeron* and one of the side

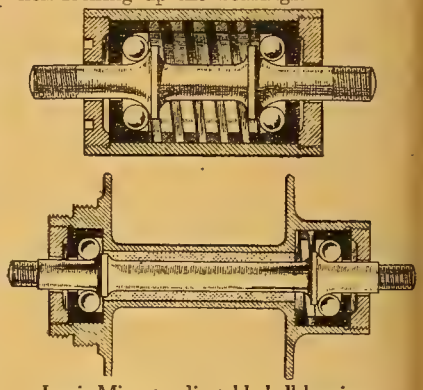


F. Baron and A. Matthews, detachable wheel. No. 139,886. 8/3/19.

members. Sufficient clearance for dropping the wheel is left between the central *longeron* and that on the other side. The wheel may thus be secured by a locking device on one side only, *e.g.*, the single nut which is standard on motor bicycles, or the multiple nuts used on Sankey light car wheels. In other words, the wheel comes away exactly like a motor car wheel, except that part of the frame is outside the wheel, which necessitates the use of a stand or jack and a certain amount of wriggling.

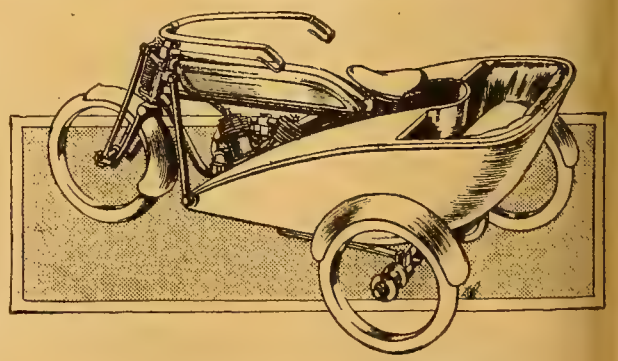
Wheel Bearings.

When a motor cyclist examines his wheel bearings, he not infrequently discovers that the inspection is overdue, and that the screwed cone or screwed cup, as the case may be, has slacked back, so that the bearing is clean out of adjustment. In extreme cases of neglect the bearing may be so badly damaged that further progress is impossible until spare parts can be obtained. Many a tour has been ruined and not a few medals lost by carelessness in this respect. M. L. Miquet propounds a bearing which is more or less locked by a spring. The ordinary method of adjusting wheel bearings is to screw them up till they bind, then slack back the adjusting member a trifle and lock the bearing up. This system gives no very rigid purchase, and the locking device is consequently left slack by a careless owner. Under M. Miquet's patent, a coiled spring or a spring washer is used to force the sliding cup outwards, so that a better resistance is provided when locking up the bearings.

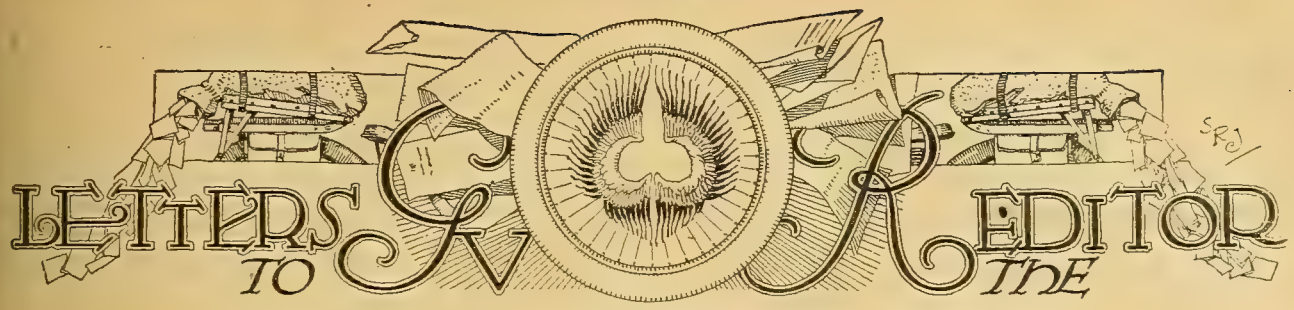


Louis Miquet, adjustable ball bearings. No. 138,591. 3/2/19.

Eng.-Lt. C. I. Brooks is an inventor who stirs my imagination in several directions. For example, he may have had trouble with a fair passenger who refused to occupy the carrier of a combination, and put in first claim to the sidecar. Anyhow, there is no doubt that the carrier seat is no great fun, and that many riders want to take two passengers. So this patent covers the removal of the back wheel of the bicycle, and the substitution of a chassis, permitting two persons to sit one on each side of the driver, the seat being preferably of the phaeton type, though, of course, two separate sidecars could be fixed to the frame. The chassis embodies a live axle with central sprocket, to which a chain from the motor bicycle countershaft is connected. The nett result is to resurrect the Avon Trimobile, plus a cycle saddle in the centre. The day of detachable passenger accommodation in the heavy lines is almost over; and if Lt. Brooks studies the history of past designs he will find that this particular layout has never made good in Great Britain, even when constructed as a rigid and non-detachable whole.



C. I. Brooks passenger machine. No. 138,682. 25/1/19.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

CHAIN DRIVE.

Sir,—I wonder whether the Show will reveal that designers have learned the necessity of totally enclosing all driving chains. There are several makes of machine which I for one would not buy because of their unprotected rear chain, although in all other respects the machines are most tempting. Mud and clay are bad enough as lubricants, but even they are not in it compared with a rich mixture of tar and flints. Ugh! My present mount (P. and M.) has its chains enclosed and automatically lubricated from the crank case. The system is quite as efficient as an oil bath. I want nothing less efficient in 1921. LY 1509.

SANS MAGNETO.

Sir,—*Re* Mr. F. C. Riding's letter, "Sans Magneto," my machine when hot would run 800 yards with the ignition switched off. I removed every speck of carbon as carefully as possible, but this made no difference.

On one occasion I stopped after 500 yards "sparkless" going and changed the plug. To my surprise the engine restarted and kept going for another 150 yards; but only on full air. Closing the air slightly caused an immediate stop.

At this point I took the temperature of the engine and proceeded to lower the compression by inserting a $\frac{3}{32}$in. washer.

Now, at the same temperature, on switching off the magneto all firing ceases, no matter what the position of the controls. R. F. McNAB.

THE A.C.U. SIX DAYS.

Sir,—Reading accounts of the Six Days Trials in your paper, I think the A.C.U. was wrong in withdrawing Park Rash, etc. It was said that they were impossible. Why? Because present-day engines are not to be compared with those of 1910-11-12. If modern gear boxes were used with those engines results would have been different.

Some time ago, when the hill was quite as bad as now, a single-geared Rudge ascended Park Rash regularly; a Rex sidecar combination also made several ascents. Of course, the present-day "knuts," who are used to the smooth surfaces of our Tarmac roads, would find the hill a bit rough; but it was nothing to worry about. Rougher and steeper hills should be included in future, and the trials held in January.

Lancashire. INTERESTED.

PETROL CONSUMPTION.

Sir,—In view of recent correspondence in your columns regarding petrol consumption, I feel it behoves me to take up the cudgels on behalf of the flat twin.

I have at the moment one of this year's $2\frac{3}{4}$ h.p. Woolers, which I have been using for all-round general work—not picking my roads or driving for economy; in fact, very much the reverse, in view of the fact that 60% of my riding is done with a pillion passenger, and that I habitually drive fast. To date I am averaging, roughly, 180 m.p.g., and on a straight main road run can do 200 m.p.g. I should be very interested to meet any of your contributors who would care to have an informal trial, in order to prove that this is not in any way a wild exaggeration.

I may say that I am not in any way connected with the Wooler Engineering Co. or the motor trade, but merely wish to give praise where it is due, and, further, to register here my appreciation of the very courteous treatment accorded me at all times by this firm. J. L. HENRY.

PLUG EFFICIENCY.

Sir,—Under the heading "Plug Efficiency," I notice "Douglasite's" remarks concerning Heath plugs, and as a user of these I feel I must put in a word for them. I successfully went through the London-Land's End trial on a 4 h.p. machine using these plugs, and have now got a 7-9 h.p. of the same make. When I got this machine I ordered some Heath plugs, and put them in instead of the original ones, and they have been in the engine without being moved for about 1,500 miles, and, as far as I can see, likely to stay thus. They are very hard indeed to oil up, and I have not yet managed to overheat them.

I have no connection with the firm, but I think they deserve every success with such an excellent product.

Sheringham. HARLEY-D.

EX-D.R.'s.

Sir,—I often notice arrangements for meetings of different sections of ex-D.R.'s. From experience I am afraid the majority of these are none too successful owing to the members being so scattered.

When recently on tour I met two old riders quite accidentally, and had an interesting chat with them over old times, although we had never met before.

It has occurred to me that if we had some method of recognising one another it would be an introduction and fill in many a dull time at holiday resorts and hotels, and one could always be sure of picking up a congenial acquaintance.

The method I suggest is to have a small blue and white circle or oval painted on the back of the lamp in not too conspicuous a position, so we may recognise an ex-D.R. at the hotel or garage.

What do other ex-D.R.'s think of the suggestion?

Manchester. EX-R.E.

DRIVING LICENCES.

Sir,—Now that there is all this agitation about dangerous driving, why cannot the authorities be more careful when issuing licences? I was astounded on paying five shillings, to get a licence enabling me to drive a motor car or motor cycle without any examination or trial. In Ceylon one had to be conversant with the rules of the road. If riding a solo, a European sergeant told one where to go, and rode behind on another motor cycle; if a combination, he came in the sidecar.

If satisfied you could drive, then a licence was issued. This would only be to drive a motor cycle; for a car another and a more severe test would have to be undergone. In Durban, Natal, the test is more severe still: eyesight, colour-blindness, speed judging, etc., as well as one's driving capabilities.

In England apparently only 5s. is needed, and one can drive a car or motor cycle anywhere, and need know nothing about it.

I consider the driving in England distinctly bad, and one frequently comes across riders blinding past cross roads, never sounding their horns. I have seen cars packed with men and girls all talking and laughing, and the driver joining in, with his attention anywhere except on his job.

From observation on the roads I consider cars are far and away the worst offenders where dangerous driving is concerned, especially fast cornering.

A combination has to slow up unless the driver wants the sidecar to tickle his ear. N. H. M. FERGUSON.

NAIVE.

Sir,—As an interested reader of your journal I should like to pass a few comments on "Moonshine's" letter *re* "Economy." Supposing we take it for granted that his wonderful increase in m.p.g. is true up to the point where he fixes streamline tank, disc wheels, and aeroplane footboards and mudguards, which works out at 100 miles to $\frac{7}{10}$ gallon, I cannot possibly see how Beacon oilskins and the very excellent Brooks saddle are going further to increase his m.p.g. Agreed, I am only an interested novice in the motor cycling world, and am always open to contradiction, but I don't think "Moonshine" convinces me that he could produce $\frac{1}{4}$ gallon every 100 miles?

Clapham Junction, S.W.11. DISABLED.

A CURIOUS ACCIDENT.

Sir,—A recent experience makes me think that a small wire face shield from the front mudguard extension would be a great improvement on motor cycles for riders whose wish is to attain a really decent speed. I was doing, roughly, 45 m.p.h. when a dove flew straight up into the air from in front of me and lodged under the peak of my helmet, temporarily blinding me, and resulting in a nasty spill.

I rode a Triumph (W.D. model), and it says much for this machine that such a speed could be attained on roads such as are found on the North-western frontier of India. This machine had been running for some months previously to this spill, and is at present still in the best of running order, and on the whole it is as good a 4 h.p. machine for all-round work as any I have ridden or heard of.

Kohal, India. E. C. COOKE, L.-Sgt. D.R.

THE SILENCE TEST IN THE SIX DAYS.

Sir,—With reference to a letter by "Single-cylinder Enthusiast," I should like to express my views as a twin-cylinder enthusiast. "Single-cylinder Enthusiast" denounces, or questions, the method of deducting marks in the A.C.U. silence test. Now, as a rider of over fourteen years' experience, I venture to say that the silencing of motor cycles has a considerable bearing upon the future of motor cycling, and that the noise of the single-cylinder model has caused more disfavour to the general public than any other type. It is a source of annoyance and irritation to everyone. I attended a recent hill-climb in this district, and the bark of the single-cylinder exhausts reminded me more of a machine gun test than anything. If we were all to go about the country in that style we should be barred by law from all places except the mountain tops. I often see youths dashing along on singles (often two-strokes) with just a long pipe serving for a silencer, imbued with the idea that the more noise they make the better impression they give as speed merchants. Now, a noisy exhaust does not necessarily make a machine more powerful, faster, or climb better. Everyone knows the sweet purr of the Scott, whether it is climbing a freak hill or passing through a quiet village, and, in my opinion, the A.C.U. judge justly awarded the full percentage of marks to the deserving team. In all the tests—general reliability, hill-climbing, simplicity, easy handling, and half-hour's speed run at Brooklands, together with silence—the Scott team was in every sense the winning team. While we have the noisy motor cycle we shall be like the char-à-banc road hog, bringing sooner or later a ban on our own heads and legislation as a nuisance to the general public. SILENT TWIN.

Llanover.

THE STATE OF THE TRADE.

Sir,—Your leader in *The Motor Cycle* of September 16th, under the above heading, strikes just the right note in these somewhat excitable times. There is undoubtedly a good deal of the snowball quality about the slump, or rather the talk about it. It started harmlessly enough, with a certain residuum of fact; but once set a rumour going in a world of rumour, it will pick up a great deal as it goes along, and, in the end, become exaggerated out of all reason. Normally, people in the motor cycle business have not expected the good times of last spring and early summer to continue, but five years of dislocation have caused many to forget realities and to lose their usual sense of proportion. The consequence is that, seeing the first real "season" since 1914 tail off into a state of comparative quietness in demand, they have become quite needlessly alarmed at what is, after all, a very ordinary state of things. The motor cycle trade always was a more or less seasonal trade, and by slowing down as it has it has simply returned to its pre-war days. The so-called "slump," therefore, is only a rather welcome and healthy sign of things settling down again to normal—to a basis on stability, in which we can make our plans with some approach to certainty.

It is notoriously perilous to argue from the particular to the general, and, much as we may regret the Sopwith eclipse—which, by the way, may yet be averted—it would be a mistake to regard what has happened there as symptomatic of the state of affairs in general. Because one concern makes mistakes, it does not follow that all are going to fall into the same errors. Others have found ways of grappling with present difficulties, and things are by no means so hopeless as some of the pessimists would have us believe. The magnitude of the Sopwith defeat is in itself a factor that militates against its being repeated. Unfortunately, it has been given very widespread and none too intelligent publicity. That is where its chief mischief lies. The British motor cycle manufacturers are fighting hard, but some of us, anyhow, are making good. FRED A. COULSON.

F. Aslett Coulson Engineering Co.

ELECTRIC LIGHTING.

Sir,—I think that many readers of your paper who read the letter of "W.B.P." in your issue of September 16th, and who, like myself, have found that ordinary accumulators will not stand the vibration when used for solo riding, would be glad if "W.B.P." would supply further particulars as to the composition of the paste he mentions.

I bought a new set of lamps of well-known make complete from a local agent a few months ago, but have not used the accumulator until recently, except for lighting a small lamp at home. Until I put it on the machine it was in perfect condition, but after a ride of about forty miles, when I examined it, I found that several pieces of the paste on the positive plates had fallen out, and were causing an internal short circuit.

This is not the first accumulator that I have used on a solo machine (my first mount was a 1903 accumulator ignition J.A.P.-engined machine), and I have come to the conclusion that an accumulator of the ordinary type fitted with celluloid separators is a constant source of trouble on a solo machine.

I shall be sorry to go back to acetylene lamps again, but unless I find a better storage battery there is no other choice.

E. TROTTER.

A DEFENCE OF THE TWO-STROKE.

Sir,—I venture to suggest that if "Chinook" and other motoring journalists had devoted as much study to the peculiar traits of the two-stroke as they have to its older brother, we should read much less nonsense about the so-called shortcomings of two-strokes. The facts are that very few drivers of four-strokes become really good drivers of two-strokes. When the readers of the good old "M.C." read of 100 miles and over being regularly covered on a two-stroke on a gallon of petrol, and this by ordinary riders, and then frequently see references to the high fuel consumption of two-strokes by your regular contributors—well, it makes a novice wonder what is the truth.

I have found that a $2\frac{3}{4}$ two-stroke is always more economical than a $2\frac{3}{4}$ four-stroke. I had, until August last year, a two-stroke, which in spite of its old age could be guaranteed to do 100 m.p.g. on the roads of the West Riding, and on several occasions it has done over 100 miles a day, two up, using less than a gallon of benzole. With regard to frames being too low, big men are the exception: and many machines are useless to a little man because of their size. Take "Chinook's" favourite mount, the Scott, which I have to kick off from the off side because the reach is too long for my legs. Yet I am not a little man. It is just as logical to ask the Scott to lower the frame for me, as it is to ask makers of baby machines to build frames to suit "Chinook's" long legs. I think every intelligent two-stroke owner will regard "Chinook's" remarks on "irregular firing" as most positive evidence that he has little knowledge of driving this type. Any two-stroke will of course four-stroke at times, but it should only be a very rare occurrence, and if it is a regular thing on "Chinook's" mount I do not wonder he cannot get economy.

"It's the way yer fingers the trigger as does it" was a favourite speech of an old army instructor, and applies to motor cycling as well as shooting, but the gun must be in perfect order.

Halifax. B 3972.

METALLIC SEAMS.

Sir,—I was much interested in "Ixion's" remarks on what he terms a metallic seam for overalls. I possess a pair of leggings fitted with this seam, which is generally known, I believe, as a lightning fastener, and I must say my experience of this idea is far different from that of the gentleman he refers to. Evidently the present article is a great improvement on the old product, as I find that it is quite impervious to wet or mud. It is apparently made of nickel silver, and any dirt which accumulates on it is automatically cleaned away in opening and shutting the seam.

I obtained my leggings in London some months ago, but I do not know where they can be obtained with this fitment locally. Can any reader enlighten me?

Birmingham. MORTON HASELER.

COURTESY ON THE ROAD.

Sir,—As a constant reader of *The Motor Cycle*, I have taken a lively interest in the recent correspondence "Chivalry" and "Courtesy on the Road," and, as a rider of the opposite sex, should like to mention that I have invariably met, not only with courtesy, but with real kindness and assistance (often proffered voluntarily), when in difficulty on the road.

A lady owner of a Rudge who says courtesy on the road is not dead.

My experience is that one has never to ask in vain, and I consider that a very high spirit of good fellowship prevails amongst motor cyclists as a whole. There may be exceptions, of course, but I am only too pleased to say I have never met them.

Incidentally, I may mention that the enclosed photograph is of a Rudge, which has seen a tremendous amount of service, has changed hands more than once, and is still "going strong"—a tribute, I think, to the hard-wearing qualities of this make of machine.

Liverpool. FAIRPLAY.

A MYSTERIOUS ACCIDENT.

Sir,—The following may be of interest to your correspondent, Mr. F. A. Boyce.

Several years ago I had a similar accident. One day whilst push-cycling, without a second's warning, I found myself and cycle in a hedge. A similar thing happened some time afterwards. Walking along a street, I pitched, without warning, head first into a shop doorway.

I consulted several doctors without result, until at last one of them recommended me to get my eyes tested. Result—found I had severe astigmatism. This was corrected with glasses, and since then, several years ago, I have not had a similar experience. HARDWICK.

Clydach, Glam.

Sir,—In your issue of September 16th I noticed an accident described by Mr. F. A. Boyce, and was struck by the similarity to an accident which happened to me.

In August, 1919, I was performing the duties of D.R. in France. Once when returning to Chateau Hardelot from Boulogne, a distance of eleven kilometres, I can remember leaving Base H.Q., Boulogne, but after that my mind was an entire blank, until next morning, when I found myself in bed at camp, feeling very sore, with several abrasions and a swelling on my head, showing a heavy fall.

I was told that I had ridden the Triumph in much more slowly than usual, and was found sitting on the saddle in the garage in a dazed condition.

I was taken to the hut, bandaged, and put to bed.

Even now, I know nothing about the accident, except that I evidently had a bad spill (the mudguard and footrest were damaged), but I must have unconsciously mounted again and ridden to the camp.

Under the circumstances, I must add that I am practically a teetotaler, and had not had anything intoxicating to drink that day. C. WALTHER.

Sir,—With reference to Mr. F. A. Boyce's letter, published in your issue of September 16th, *re* his "Mysterious Accident," although I have fortunately met with no such accident, perhaps my experience will suggest a solution.

A few months ago I had an operation, and anyone who has had a similar experience will remember the peculiar droning noise while the anæsthetic is being administered, and how the drone increases as consciousness goes.

While riding in certain makes of motor cars I experience the same noise, and if I am not very careful I either fall asleep or lose consciousness. The same thing happens when near a steam boiler under high pressure.

May I suggest that if Mr. Boyce has been under an anæsthetic, the noise of his machine resembles the "drone," and that he gradually—without finding himself going—lost consciousness.

W. S. WHITTARD.

MOTOR ATTACHMENTS.

Sir,—Your correspondent, "BY," is enquiring *re* J.E.S. attachment.

I have had one of these for some time, and must say that, with the exception of slight adjustments, brought about by the machine being out of condition—a second-hand one when bought—it has given me every satisfaction.

In the first place, previous to its purchase, I knew absolutely nothing about motors, had not the slightest idea how the engine worked beyond the fact that an explosion had something to do with it. The simplicity of its construction and control enabled me to master it without any instruction beyond the booklet issued by the makers.

To the man who has not the convenience for the storage of an ordinary motor cycle, and does not require to attempt breaking records, it is an ideal mount. Its petrol consumption is very low, and its reserve of power extraordinary. With a little pedal assistance up very bad hills I have often passed other motor cycles, and, in one or two instances, motor cars.

I have had no experience with Auto-wheels, which, I think, might be suitable to a lady's mount, but with a gentleman's cycle it cannot "hold the candle" to the J.E.S.

My only regret is that I am not in a position to purchase an up-to-date model. W. J. WATSON.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/2
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/2
"THE MOTOR CYCLE" ROAD MAPS **England and Wales, Scotland, London** (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	6/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Is Overlap Necessary?

May I trouble you for advice on valve timing a 3½ h.p. three-speed countershaft 1918 model Rover. Should the exhaust valve be completely seated before the inlet valve attempts to open? I was trying the other day a 3½ h.p. Sunbeam, which runs finely, and on turning the engine round per kick-starter I noticed that the inlet valve commenced to open before the exhaust was properly seated. Should that be so on my 3½ h.p. Rover? Also is $\frac{7}{16}$ths of an inch before top centre of compression stroke the correct setting for spark? I take it that the contact breaker should be just opening when set in position as stated (sidecar work).—L.B.

It does not follow that the exhaust valve should be completely seated before the inlet commences to open. Many engines run best when a certain amount of overlap is permitted. For ordinary work set the valves so that the exhaust closes when the piston reaches top dead centre or even a few degrees after it has passed this point, while the inlet valve should at the same time be just commencing to open. The amount of spark advance is about correct. A useful setting for all ordinary work is for the spark to occur when the piston is at the top of the compression stroke with the ignition control two-thirds retarded; the spark takes place immediately the contact breaker points are separate.

Adapting Machine for Sidecar.

My 1919 3½ h.p. Sunbeam is geared too high for sidecar work. The top gear appears to be in the neighbourhood of four and a half to one. I know I shall need to change one of the sprockets. (1.) Which sprocket needs changing to carry out the alteration? (2.) Can the alteration be carried out by an amateur with the usual kit of tools? (3.) The sidecar has a left hand pull. What is the best method of lining it up? (4.) What is the best position for the passenger in relation to driver?—W.J.V.

(1.) The makers will supply you with a sprocket to make the necessary reduction in your gear ratios. It is only necessary to change the chain sprocket on the right hand side of the gear box, a reduction in the number of teeth here making the necessary alteration. (2.) Yes, it is only a few minutes' work to change the sprocket, but in addition to this it will be necessary for you to shorten the rear driving chain accordingly. (3.) By putting the combination on a flat floor and obtaining two long strips of wood such as match-boarding with planed edges. Place one of these long strips so that it touches the back and front edges of both bicycle wheels, and place the other so that it touches the back and front of the sidecar wheel. It should now be an easy matter to line up the sidecar so that the measurements between the planks at the rear and front of the machine are equal. (4.) About level or slightly behind the driver.

Speed Wanted.

I am the possessor of a late 1919 4 h.p. Triumph, fitted with Sturmey-Archer three-speed gear. I wish to obtain the greatest possible speed from it, and would be very much obliged if you would answer the following: (1.) My present engine sprocket has seventeen teeth, giving a gear of 4.4 to 1. Is this the best? (2.) What size jet do you recommend for my Triumph carburetter? (3.) Should I get more speed by fitting an automatic carburetter? (4.) The Triumph only has one timing pinion. Does this prevent tinkering with the valve gear for purposes of tuning? (5.) My speedometer is fixed on the front wheel, and as on all Triumphs the forks are very active, about how much at, say, 45 m.p.h., does this affect the accuracy? (6.) About what speed, in its present condition, just decarbonised and compression made perfect, should it be capable of doing? (7.) How much could I increase this?—J.F.B.

(1.) It is not advisable to use a larger sprocket than the 17 tooth which is already fitted. (2.) The jet size is best found by experiment. It will be somewhere in the neighbourhood of 30 or 32. (3.) It is impossible for us to tell you definitely what greater speed can be obtained by fitting any other carburetter. (4.) You cannot make much alteration in the timing, as whatever adjustment you do affects both valves. (5.) Speedometers are not usually absolutely accurate, but it is doubtful if the action of the front fork has an appreciable effect on the reading. (6.) About 55 m.p.h. (7.) You might increase this to 65 m.p.h., but it is extremely doubtful unless you have special facilities for tuning and testing.

HILL-CLIMBING IN THE SOUTH-WEST.

An Enfield sidecar making a fine ascent of Huccaby Hill in the recent hill-climb of the Plymouth and District M.C.C.

Prices.

That car prices are beginning to fall must not be regarded as a sign that motor cycles will follow suit. 1920 motor cycles are at present about 100% over 1914 prices—cars went higher than that.

Cobalt in England.

Cobalt—the rare element used in the manufacture of high grade steel—has been discovered in the Peak District. Hitherto England has had to depend upon imports for her supplies which have come chiefly from Ontario, Canada.

Found.

Eight miles from Canterbury Mr. H. Nelson Smith, of Whitley, near Coventry, recently picked up a tool kit, and Mr. Gordon Oliver, of "Glentworth," Conway Road, Pontypool, made a similar find in his town. Mr. D. Anderson, The Holt, Forest Road, Loughborough, also found a motor cyclist's flying helmet in Rugby on the 11th.

Steam and the Fuel Question?

Inspired no doubt by recent enormous increases in the running costs of the average heavy four-seated car, the Stanley steam car is being revived. A description of the latest model appeared in *The Autocar* of September 25th, and is worthy of study, both from the private motor-cyclist's and the designer's point of view. The economy and simplicity, especially of control, weighed against the slow start from cold, and the possibly somewhat unwieldy layout still leaves a strong case for experiment. At the same time, a steam motor cycle embodying modern discoveries will require considerable development.

A George Brough Production.

That well known rider, George Brough, who has recently severed his connection with W. E. Brough and Co., will shortly produce a new motor cycle. As might be expected, the production is designed in order to appeal to the sporting fraternity, and from a careful examination of the drawings we feel confident that it will enjoy a bright future. It is hoped that the first machines will be on the road this year and preliminaries are well on the way. We have been specially requested not to divulge details at the present moment, but our best wishes go with the designer in his new venture.

A Scottish Open Hill-climb.

The Glasgow Western M.C.C. is holding an open hill-climb on Garshake Hill, Dumbartonshire, on October 2nd, and in addition to the class prizes there are several special awards, including a head lamp and generator. Last year this event attracted eighty-seven entries.

"The Racing Motor Cycle."

Members of the I.A.E. in Wolverhampton and district who are interested in super-efficient motor-cycle design should spend an instructive evening on October 6th, when Mr. Cyril Williams (of A.J.S. and T.T. fame) will read a paper on the above subject in the Talbot Hotel, Wolverhampton, at 7-30 p.m.

Another A.A. Benzole Station.

The fifth A.A. benzole filling station was opened on September 22nd outside Dunchurch, near Rugby and Coventry, on the main London-Birmingham road. A five-hundred-gallon Bowser installation is laid down, and the usual A.A. roadside service facilities are available. The opening of the depot was attended by a number of prominent Midland motorists and motor cyclists.

Power Alcohol.

The question of denaturation of alcohol appears to be the chief difficulty in the way of the unrestricted manufacture of power alcohol. Readers of *The Motor Cycle* who are chemists are invited by Sir Charles Bedford, LL.D., D.Sc., of the Empire Motor Fuels Committee, 50, Pall Mall, S.W.1, to suggest a suitable denaturant which shall have the following qualities: *(a)* Deterrent taste and smell, *(b)* non-poisonous, *(c)* must not be removable at a commercial cost, *(d)* must be readily detectable in small quantities, *(e)* must be readily miscible with the spirit, and *(f)* must be inexpensive. Communications should be marked "Denaturation," and will be treated as strictly confidential. Suggestions will remain the sole property of the proposer.

We must have a Petrol Alternative Produced within the Empire.

Special Features.

SIX MONTHS WITH A FAMILY SIDECAR.

IMPRESSIONS OF THE SCOTTISH "TWO DAYS."

Rubber Output.

In view of the rapid decline in the price of raw rubber, and of the fact that if production continues at the present rate there will be a surplus of anything from 35,000 to 40,000 tons of rubber at the end of 1920, the council of the Rubber Growers' Association, at a recent meeting held in London, unanimously decided to recommend to all producers of plantation rubber that a genuine reduction of 25 per cent. of the estimated normal monthly output should forthwith be brought about.

120 m.p.h. at Brooklands.

Hundreds of motor cyclists were intermingled with the many thousands who saw the last official B.A.R.C. meeting last Saturday at Brooklands. Of the nine races on the card all were for cars, and in three of them cycle cars showed up prominently. J. Cocker (the old Singer and Triumph exponent) ran second by a few yards to W. D. Hawkes on a Morgan in the first race, though Cocker's 8 h.p. Crouch was actually lapping at over 70 m.p.h., and it is difficult to explain why he eased down too soon in the finishing straight.

An eight-cylinder-in-line Ballot was on scratch in the second event, and the way the driver overhauled most of the field in this and other events was fine to behold. He streaked down the railway straight at 120 m.p.h., and actually covered one lap at 112.17 m.p.h. Frazer Nash's G.N. was in fine form as usual, and dashed over the line at 78½ m.p.h., 1⅗s. ahead of a Straker-Squire. Cocker (Crouch) scored another second in the third race.

What is described as the finest finish ever seen at Brooklands occurred in the sixth event, six cars crossing the tape at speed within 30 yds. of each other. W. D. Hawkes, this time driving a Lorraine-Dietrich of 15,095 c.c. cylinder capacity, romped home first in the Seventh Lightning Long Handicap at 95.18 m.p.h., his 33s. start proving too much for the fleet little Ballot piloted by Chassagne. In the next race Hawkes repeated his success on a Morgan with a four-valve M.A.G. engine, just beating Godfrey's G.N. at a speed of 71¼ m.p.h. Frazer Nash won the last sprint handicap on his G.N. at 73.84 m.p.h.

A detailed account of the racing will appear in Friday's issue of *The Autocar*.

158 Mile Trial in Worcestershire Lanes.

Thirteen Test Hills included in Sporting Event organised by West Midland Clubs.

Flagstaff Hill, near Great Witley, is a vantage point from which many pretty views of the surrounding country may be seen. The Enfield rider, F. Bicknell, is more intent on finding a good path for his driving wheel, however.

OVER a hundred competitors started last Saturday from Bromsgrove to cover 158 miles of typical Worcester lanes included in the West Midland Reliability Trial. The event was organised by the Wolverhampton, Redditch and Kidderminster Clubs—and it was clear that each had contributed its share in the route planning. Thus the first part of the morning section included hills used by the Redditch Club, and later on the competitors were taken over ground more familiar to Kidderminster and Wolverhampton riders.

A Foggy Start.

The whole of the course was planned within a small radius, and turned and twisted in such a way that the stranger soon lost all sense of direction, making good route marking absolutely essential. A few arrows removed by mischievous children caused several to go astray in at least three sections of the route, which led one to think that a pilot car immediately before the first competitor, with a plentiful supply of confetti, would have better served the purpose.

At the start, and in fact for many miles, a thick fog prevailed. (T. C. de la Hay (Sunbeam) did not start owing to his machine being in collision on the way to Bromsgrove.) The weather conditions made matters a little difficult for the competitors to maintain their schedule speed.

Beacon Hill is not very severe, excepting in wet weather. On Saturday it was dry, excepting for a patch of deep mud at the bottom. Near the top, however, the competitors were diverted from the lane to take in a sharp hairpin, which meant a left right angle turn, immediately followed by a right-hand hairpin so acute that it was impossible for a Morgan to negotiate it, and many of the solo and sidecar entrants could not get round without hitting the bank.

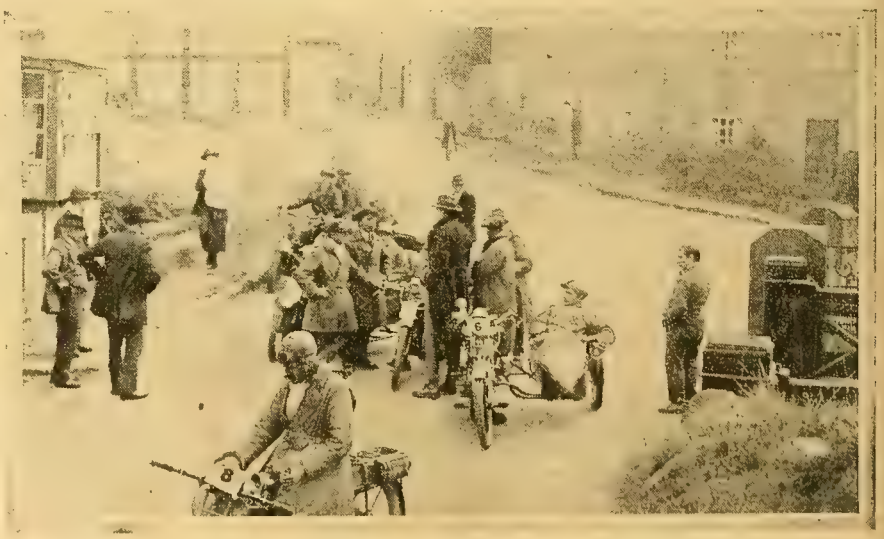
J. G. Nickson, the captain of the Kidderminster Club, on a single-geared o.h.v. single-cylinder Aero, stopped, as was to be expected. V. Collins (4¼ B.S.A.) ran into the hedge and fell. C. F. Foster (2¼ Enfield) ran beside his machine and elected to miss the hairpin, E. A. Humphries (2½ Priory) foot-slogged and stopped, and A. L. Horner (4½ James sc.) skidded round and lost his sidecar tyre. On the whole, however, the performances were good. H. Boynton (6 James sc.) executed a very neat turn, as did J. Walker (2¾ Marloe), B. L. Bird (2¾ Marloe), T. B. Haddock (6 A.J.S sc.), and O. Wade (6 A.J.S. sc.).

Troubles.

After Beacon, eight miles brought the competitors to the second test hill—Gravel Pit—which did not unduly trouble the majority. It is a short steep climb with a loose surface of shingle, which caused a certain amount of wheel slip. F. A. S. Fletcher (8 Enfield sc.) had his passenger on the carrier, as had F. Bicknell on a similar machine; this was hardly necessary. W. A. Carr (Morgan), J. Wainwright (8 Matchless sc.), D. S. Heather (4¼ B.S.A. sc.), and C. W. Hyde (4¼ B.S.A. sc.) all made very steady climbs. C. F. W. Rendle (3 Enfield) fell, while Albert Milner (2¼ Diamond) was evidently in trouble for he had to foot slog. It afterwards transpired that he had a broken piston ring, and was overheating badly which caused him to retire. F. J. Price (2½ Diamond) went up in a very dashing manner.

The Scott, ridden by H. Langman, toured up with ease, as did most of the Nortons and B.S.A.'s, while C. F. Sturgess, on a single-geared Rover, performed splendidly. H. Greaves (Beardmore-Precision) found that his comfortable spring frame was a disadvantage for freak hill-climbing. His wheel spun and he came to a standstill—his only stop in the long trial.

In a further three miles the competitors were crowding at the foot of the Gaby Glide, a muddy lane, easy enough



LOST! This little group consists of competitors in Saturday's West Midland Open Trial who, despite following the arrows, have missed their way. Route marking is (or should be) one of the organising secretaries' chief responsibilities, but often the best efforts are frustrated by mischievous small boys.

In Worcestershire Lanes.—

for the solo men, who could traverse its centre, but more difficult for the sidecars, which demonstrated why the hill had been given its name.

The competitors were sent up one at a time, with the result that much time was lost by all but the first arrivals, which made it questionable whether the time factor for the morning section could be used in allocating the awards, as some of the riders were kept waiting for upwards of half an hour. An opportunity to make up some of this time was found afterwards between the hill and Malvern. A water-splash near Redditch was cut out, and the competitors had a twenty-five miles stretch of easier roads to the Old Wyche at Malvern.

This hill has now lost its former terrors, but, of course, took its toll of failures. Then came a further fifteen miles of comparatively easy going *via* Bishop's Frome to Bromyard, six miles beyond which town the competitors came to Ankerdine Hill for the flexibility test. Of good main surface and a maximum gradient of about 1 in 8, Ankerdine Hill was very suitable for this test; 25 yds. had to be taken slowly, and 75 yds. fast—timing was done by Mr. T. Silver.

Flexibility Test up Hill.

On the whole, it could not be said that the majority went through this test with honours. Some occupied more time for the fast section than they did for the 25 yds. slow portion, and the two times of many others were practically equal. The good performances were, therefore, very conspicuous, and out of the eighty-five competitors who were timed, we may mention the following fifteen as being worthy of recording. Those who failed to halve their slow time are not given.

	25 yards slow. secs.	75 yards fast. secs.
F. F. Watson (4 Norton sc.)	35½	15
E. A. Colliver (Indian Scout)	20⅘	8½
H. Boynton (6 James sc.)	39⅖	12⅘
B. Bladder (8 New Imperial sc.)	24⅘	9⅗
B. L. Bird (2¾ Marloe)	24⅘	9⅗
Eric Williams (6 A.J.S. sc.)	25½	15
F. J. Price (2½ Diamond)	20⅘	10⅘
L. L. Sealey (4¼B.S.A. sc.)	18⅘	8⅗
L. Paynter (Norton)	21⅘	10⅘
F. Bicknell (Enfield sc.)	29½	18½
H. W. Hassell (Norton)	19⅘	8⅗
G. Dance (3½ Sunbeam sc.)	25⅗	10½
C. Wilson (Norton)	20½	9
H. B. Denley (8 Morgan)	46⅘	13½
S. H. Rhodes (2¾ Wolf)	20⅘	10⅗

A stopping and restarting test was included at the seventy-fifth mile, at which point the riders were near Shelsley Walsh. A further five miles brought them to Flagstaff Hill near the Hundred House, the luncheon stop. On Saturday the hill was dry, and instead of the usual great percentages of failures, the competitors climbed with monotonous success. H. C. Rhodes (3½ Sunbeam) seemed a little unhappy and ascended with both feet out ready to counteract a skid; F. J. Price (2½ Diamond) broke his belt; E. A. Humphries (2½ Priory) had to run beside his mount.

G. Denley, on a little Velocette, ascended to the accompaniment of a rhapsody whistled by himself. A. W. Taylor (B.S.A.), R. Clark (Coulson), Reg. Brown (3½ Sunbeam sc.), and R. Duke (Triumph) cruised up in company. W. J. Edwards (2⅘ Omega) had to regulate his speed to that of a sidecar. The L.M.C. sidecar, driven by H. E. Ashley, had plenty of power in hand, and the Morgans and T.B. again did well. H. L. Willis (3½ Norton), H. Maule (Rover sc.), H. Ward (4½ B.S.A. sc.), F. J. Adam (A.B.C.), H. Langman (Scott), George Dance (3½ Sunbeam sc.), P. Newman (3 Ivy), A. E. Colliver (Indian Scout), A. Wilkes (3½ Rover), A. Wood (B.S.A.), Reg. Brown (3½ Sunbeam sc.), and Dudley (3½ Sunbeam sc.) were all fast. Conspicuous among the lightweights were the two O.K.'s, ridden by Hall and Handley, H. Greaves (Beardmore Precision), Seymour Smith (3 Ivy), L. A. Bees (Beardmore Precision), H. U. Smytheman (3 Ivy), and B. Gold (Wolf). R. G. Bennett (2⅘ Federation) was steady and the Verus, H.B., Wilkin, and Marloe machines with 2⅘ Blackburne engines, also showed up to advantage. Throughout the trial the value of a good lightweight machine, even in the hilliest districts, was amply demonstrated by the various riders of these machines.

H. U. Smytheman (3 Ivy), W. J. Chambers (3½ B.S.A.), R. Cooper (2½ Allon), and other competitors waiting their turns for the greasy ascent of Gaby Glide. The width of the lane will be noticed.

The Afternoon Route.

After lunch at the Hundred House, another four test hills were taken within twenty miles. They were located among the hills lying west of the Severn, between Bewdley and Bridgnorth. The competitors had now got accustomed to their characteristics, and failures were rare exceptions. In less than thirty miles, Farlow Bank was being negotiated, and as the surface was greasy, failures were rather more frequent, although on the whole the machines did well.

Probably the worst section in the trial was the six-mile run to the next check. There were several gates to be opened, from which it may be gathered that the route lay through rough farm tracks. One of the Marloe riders accomplished the journey with a flat front tyre, and his pluck in so proceeding was admired by those of his fellow competitors who saw his gymnastics.

Another ten miles brought the riders to Bridgnorth, where several went astray through interference, on the part of boys, with the arrowing. Quite a number, including an official car, missed the acceleration and brake test.

Marks of merit for this test were awarded on the basis of time in seconds required to cover 100 yards plus the number of yards required in which to pull up. Those whose figure of merit was more than fifty per cent. higher than the average in their particular class lost five marks. Some competitors had been at work with mathematics and found that it was to their advantage to lose seconds on time in preference to taking several yards to pull up. Consequently a few stopped dead on the line, and those in charge were a little mystified as to how to deal with them.

Off the Route.

In the meantime, a bunch of competitors filled the quaint little village of Claverley, having realised that they had gone astray. Presently they were joined by two riders who had just been through the test. Several of the solo riders went back, but the sidecarists elected to proceed and trust to a united protest later.

Five miles further on along the lanes was located the last observed point—another sharp hairpin which the three wheelers could not negotiate without a reverse gear. Here the T.B. showed the advantages of such a feature, for the driver, by reversing three times, smartly manœuvred his vehicle round.

Here we noticed that Dance's featherweight sidecar was leaning badly. He executed the turn in good style, as did his colleague, Dudley, on a similar machine fitted with a standard touring sidecar.

Most of the solo riders made neat turns, some came near to striking a wall on the

In Worcestershire Lanes.

last few inches of the hairpin, and a few stopped. Quite a number approached the corner at a high speed, and others were just as slow and sure. Cyril Williams (this time mounted on a Norton) and J. A. Newman (3½ Sunbeam sc.) were among the latter. H. C. Haddock (6 A.J.S. sc.) in changing gear unfortunately got into neutral; J. Wainwright (8 Matchless sc.) took the wrong hairpin a little lower down, and on discovering his mistake executed a turn in the length of his machine, and then negotiated the observed corner. E. A. Humphries (2½ Priory) cut the bend too fine, and stopped. The last ten miles to the finish at the Stewponey Hotel, on the Wolverhampton-Kidderminster Road, was chiefly over lanes. At the finish a huge crowd had assembled to welcome home the seventy-two survivors of a gruelling day.

A Heavy Toll.

Approximately thirty retired (ten within the first sixty miles), which appears to be a heavy toll, but undoubtedly not a few of this number lost the course—quite an easy matter even for those who knew the district.

M. Holroyd (Beardmore-Precision) entered the check from the wrong direction, having missed an arrow at some point where probably it was hidden by the trees. His time was not taken.

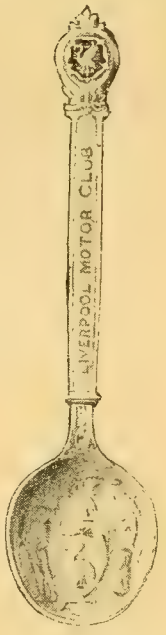
On the whole, it was a successful trial, but the arrowing was not all the competitors desired, for which mischievous boys were partly responsible, and against such a contingency it was difficult to guard. At one point the arrows had been so arranged that competitors would have been repeating a circle; fortunately, an official was able to remedy this before much harm was done.

RELIANCE CUP TRIAL RESULTS.

THE weather conditions rendered the trial, fully described in our last week's issue, extremely severe, and it is not surprising that only seven machines, all solo mounts, came through without loss of marks. Particular merit also attaches to the performance of the only four sidecar outfits finishing, which gained three silver and one bronze medal, as the rain which fell on Friday night (in the words of the judges themselves) "made the surfaces of Conquering Hero, Alt-y-Bady, and Dolywern an unfair test for sidecar machines." The principal awards went as follows:

RELIANCE OPEN CHALLENGE CUP.—Eric Williams (3½ Sunbeam).
BUTTERWORTH CHALLENGE TROPHY.—V. E. Horsman (3½ Norton).
RELIANCE AMATEUR CHALLENGE CUP.—N. C. Sclater, junr. (3½ Norton).
MOGRIDGE MEMORIAL CHALLENGE CUP.—Jack Fox (4 Norton).
MEAD CHALLENGE CUP.—J. A. Newman (3½ Sunbeam).

The five competitors above and the only two Humbers entered, L. Crisp and W. Brandish (4½ Humbers), gain gold medals. The actual destination of the trophies amongst these seven was decided by the formulæ results of the hill-climb on Bwlch-y-Groes.



SILVER SPOONS FOR WINNERS OF SPECIAL PRIZES IN LIVERPOOL M.C. EVENTS.

Handsome silver spoons, finished in enamels and 9in. long, are being presented as special prizes in competitions organised by the Liverpool M.C. This is an innovation which will be appreciated by those who consider a medal a useless kind of award.

The machine team prize went to the Norton team (V. E. Horsman, Jack Fox, and N. C. Sclater), the only complete team to lose no marks.

Fastest times on Bwlch-y-Groes were made by G. Dance (3½ Sunbeam), 2m. 2s., and Eric Williams (3½ Sunbeam), 2m. 3s.

The following also finished and gained awards as stated:

SILVER MEDALS: J. H. Green (6 Martinsyde sc.), H. R. Davies (6 A.J.S. sc.), H. Haddock (6 A.J.S. sc.), J. Lee (7-9 Indian), J. Davies (4 Triumph), H. Langman (3¾ Scott), S. W. Ratcliffe (3½ N.U.T.), G. Dance (3½ Sunbeam), G. J. Baragwanath (4 Triumph), S. Parker (2¾ Wilkin), C. Hunt Fox (4¼ B.S.A.), E. B. Williams (4 Triumph), G. Strange (3½ James), P. K. Glazebrook (3½ Campion), and R. B. Clark (2¾ Coulson).

BRONZE MEDALS: G. E. Stobart (7 James sc.), Miss P. Davie (4 Norton), H. Marston (4 Triumph), J. C. Walker (2½ Edmund), S. V. Banner (8 Sunbeam), H. Roberts (6 A.J.S.), G. D. Addinsell (4 Triumph), H. W. Sellars (3½ Sunbeam), G. Roddick (8 Zenith), G. Shayler (3½ Sunbeam), F. Porter (2¼ Levis), J. F. Lidstone (2¼ James), R. Jones (3½ Sunbeam), and H. Newey (2¼ Levis).

The respective figures of merit in the timed hill-climb were as follows:

	Figure of merit.
Eric Williams (3½ Sunbeam)	19258
V. E. Horsman (3½ Norton)	20637
N. C. Sclater, junr. (3½ Norton)	32148
Jack Fox (4 Norton)	40534
J. A. Newman (3½ Sunbeam)	44421

The club team prize was not awarded, as no complete team qualified.

A BENZOLE PROPOSITION.

THE following letter has been received putting forward a suggestion for benzole production in local centres. We print it in full in that it is well worthy of careful attention from all motorists and motor cyclists.

"Sir,—The only solution of the petrol problem is to produce motor spirit ourselves, but colliery owners cannot be expected to provide large sums of money for the necessary plant so long as questions like nationalisation, direct action of trades unions, war taxes, etc., remain in their present unsettled condition. Great Britain can produce from material going to waste or lying fallow in our coalfields all the motor spirit and other oils required for home consumption.

Individual Effort Not Possible.

"In view of the fact that it is unreasonable in existing circumstances to expect the colliery owners to provide the necessary money, it is 'up to' petrol users to help themselves and also 'up to' someone who understands the business to come forward with a sound and practical proposition. Here it is:

"One of the most reputable constructional engineering firms in this country will contract to supply and erect a plant to treat 300 tons of material per day of eight hours at an inclusive cost of £20,000.

"In addition to the cost of the plant, £10,000 will be required for working capital.

Local Distilleries.

"Responsible colliery companies will contract to deliver to the plant 300 tons per day of material which, on distillation, will yield not less than two gallons of motor spirit and twenty gallons of crude oil per ton.

"This plant will produce 180,000 gallons of spirit per annum and 1,800,000 gallons of crude oil. The cost of the raw material will be £35,000 per annum, treatment, administration, depreciation £15,000, making the cost of motor spirit, say, under 1s. 6d. per gallon, and 5d. per gallon for crude oil. It is easy to calculate at current prices what a handsome return this will show on the capital invested.

"There will be no necessity for the establishment of any elaborate or expensive distribution organisation, as the spirit would be produced for distribution and sale as far as possible in the immediate district, and provision for the necessary cans is included.

"Following the successful operation of this plant, similar installations could be put up in various parts of the country where raw material is available and of a capacity to meet the requirements of the surrounding district.

J. ARTHUR GREEN,
Editor 'Treatise on British Mineral Oil'; hon. sec. and technical adviser on mineral oil supplies to 'Committee on Production of Oil from Cannel Coal and Allied Materials'; late H.M. Petroleum Research Department (Admiralty) and Ministry of Munitions, etc.

F. MOLLWO PERKIN,
C.B.E., Ph.D., F.I.C., F.C.S.,
Technical adviser on retorting to 'Committee on Production of Oil from Cannel Coal, etc.'; member Council of Institution of Petroleum Technologists, etc."

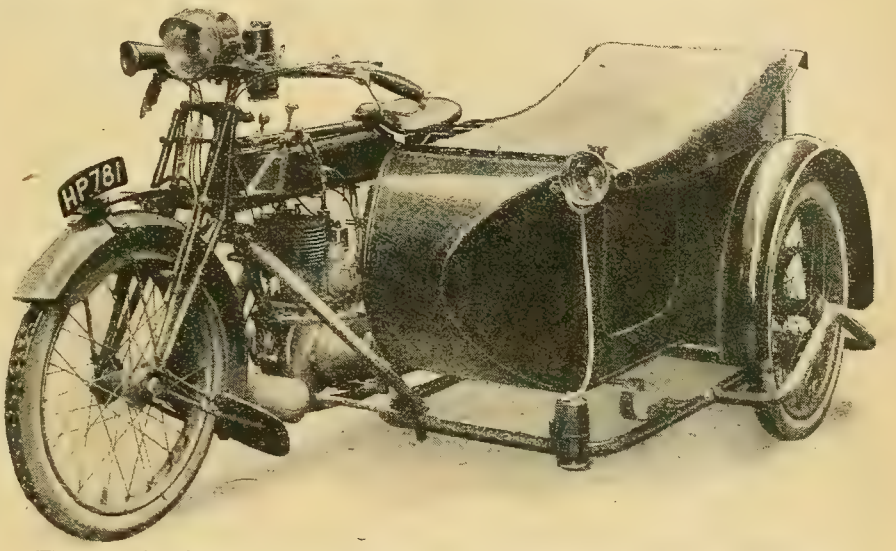
A NEW SUNBEAM SIDECAR.

A Light and Comfortable Attachment intended especially for the 3½ h.p. Mount.

HAVING conclusively proved to their own satisfaction that the 3½ Sunbeam is capable of taking a sidecar anywhere in reason, and having publicly demonstrated the fact in several severe trials, Messrs. John Marston, Ltd., set to work to produce a sidecar suitable for the machine, and incorporating their usual high-class workmanship and finish. The results may be seen from our illustrations to be in keeping with Sunbeam traditions.

A roomy and well finished body is carried by C springs—both fore and aft—on a chassis of very simple construction. The main portion of this chassis is composed of a rectangular tubular frame from which the wheel is supported by stout brackets both inside and out. The wheel, by the way, is detachable and interchangeable with those of the motor cycle, being shod with 650 × 65 mm. tyres. A very wide mudguard is attached to the body so as to prevent rattles; the space between body and guard is entirely filled in by a special flange.

Two front attachments are supplied in addition to the special Sunbeam rear joints, and all the fittings are integral with the chassis, so that correct alignment is ensured.

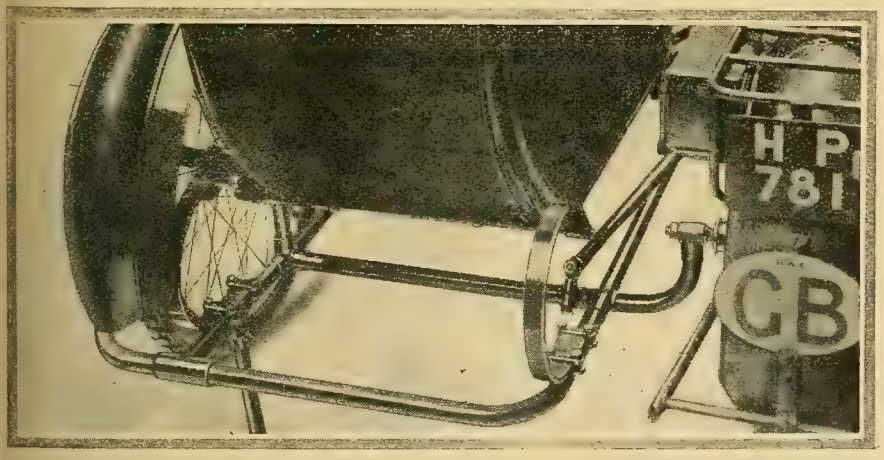


The new 3½ h.p. Sunbeam sidecar, the chassis of which is designed to accommodate an interchangeable wheel. The mudguard is attached to the sidecar body.

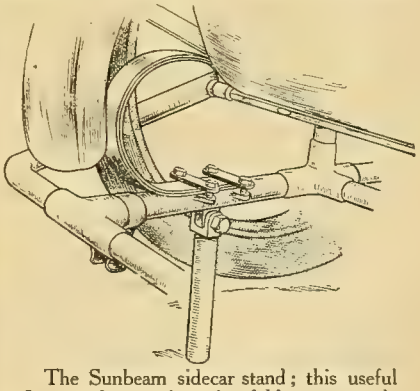
A Sidecar Stand.

In order to facilitate wheel removal, a very handy sidecar stand is fitted behind the axle. This very taking sidecar is listed at 45 guineas complete, with waterproof apron and mat, but an extra charge is made for a spare wheel.

We have had some personal experience with the combination illustrated—the latest addition to *The Motor Cycle* stud of machines. The solo mount is the one we have had in use for some thousands of miles with every satisfaction, and it has now been set to fulfil the far more difficult task of propelling a sidecar. The gallant 85 × 88 mm. engine is well able to maintain a good average uphill and down dale. Thanks to the integral fittings on the bicycle the sidecar itself is so perfectly adjusted that it is possible to travel along a good road with hands off the handle-bars. Our passenger, too, speaks very highly of the comfort provided by the well upholstered sidecar. Under the seat, by the way, there is a capacious compartment for tools and spare parts.



The simple construction of the chassis will be observed; the sidecar stand is shown in operation.



The Sunbeam sidecar stand; this useful fitment when not in action folds away neatly and unobtrusively.

THE PRICE OF PETROL.

ON Friday last a deputation representing all classes and interests in the City of Coventry waited upon the Mayor in order to discuss the effect of the rise in price of motor fuels upon the well-being of the community. After discussion, the following resolution was passed:

"This deputation, representing all classes, professions, and trades in Coventry, views with the utmost concern the steadily rising price of motor fuel, and calls on you, as chief magistrate, to send urgent representations to His Majesty's Government pointing out the danger to the community, and requesting them to take immediate steps to secure the production and distribution of power alcohol within the Empire, under the immediate supervision and control of the Government; also to ensure that the coal consumed in this country shall be so treated before use as to extract all the possible available motor spirit."

The Mayor clearly recognised the extreme gravity of the situation, and he expressed his sympathy with the objects of the deputation, and promised to communicate their views to the Prime Minister, the members for the city and county, and the Minister of Transport.

A TRIAL FOR TWO-STROKES.

43 Starters and 27 Finishers in the Bowerman Cup Competition at Leicester.

ALL the well-known and several less popular makes of two-stroke machines were represented in the contest for the Bowerman Cup held by the Leicester and District M.C.C. on September 26th, and if some of the former failed to show up very well, it was neither due to the fault of the machine nor to the severity of the course.

There was a singular absence of mechanical and even tyre trouble throughout the event, and the low proportion of finishers is due to the fact that some competitors, finding themselves early penalised for foot-slogging, etc., did not consider that their chances of gaining the premier award were strong enough to justify carrying on.

Glorious weather and great public interest favoured the start from Humberstone Gate, and the going was good, if sometimes rough, to the first observed hill, Sludge Hall, which boasted a maximum gradient of about 1 in 8 in the course of a straightforward climb. C. J. Willcox, on the only Scott present, naturally shone, but the performances of some, who *ought* to have made light of it, were disappointing.

The course then led on to Tilton, the first check, and a little further on to the *pièce de résistance* of the trial. Down a steep path in the centre of a disused road, the competitors were warned of something afoot by the gathering of spectators at the bottom. Large boulders (placed there for the event, we were told) effectively prevented an otherwise trivial watersplash from being rushed, and a grassy rise on the other side proved too much for many a slipping belt. The riders of chain-driven machines went by wreathed in smiles, whilst among the belt-driven mounts F. Brown (Clyno), D. S. Taylor (New Hudson), and H. M. Flint (Broler) were noticeably sure. Almost before the belts had time to dry, the course led through a trackless field, where an ascent of about 1 in 7, marked out by flags, spoiled many hitherto clean sheets. Launde, the next observed hill, too, claimed its quota of failures, albeit needlessly, for L. B. Crowther (O.K. Junior) showed that it was possible for a single-geared machine. The circuit, including Launde Hill, the watersplash, and the nameless grassy bank was covered three times; but the extremely low scheduled speed (15 m.p.h.) allowed many belts to be tightened.

While the destination of the Bowerman Cup cannot be settled until the observers' reports have been checked, we venture to prophesy that it will fall to a chain-driven machine, and were it not that the Scott forfeited forty marks initially on account of its capacity the rider of this machine would no doubt have carried it.

The following finished, but only a small proportion without the loss of any marks:

P. J. Strong (Broler), F. Brown (Clyno), P. Goodman (Clyno), A. F. A. Clark (Welland B), C. J. Willcox (Scott), J. W. Mill (Connaught), L. B. Crowther (O.K. Junior), F. Morgan (Cotton), D. W. Blocksedge (James), S. Brooks (Broler), F. J. Tanner (Broler), C. Trasler (Broler), D. S. Taylor (New Hudson), G. Denby (Velocette), G. E. Jackson (Chater-Lea), W. H. Bellamy (Metro-Tyler), F. Wooley (Sun-Vitesse), H. Petty (Velocette), A. C. Yates (Triumph), R. W. Banbury (Ixion), J. Gilbert (Ixion), R. Pendleton (Coventry Eagle), R. G. Winn (Campion), L. G. Growatt (Alldays Allon), — Ward (Campion), B. Rowley (Clyno), and H. W. Turner (Clyno).

THE BUTLER CUP EVENT.

Sporting Half-day Trial by Surbiton Club.

FAVOURED with cool autumn sunshine and a representative entry for a club event, the first annual half-day reliability trial organised by the Surbiton and District Motor Cycle Club on Saturday last, September 25th, promised to be a great success.

The thirty-five competitors were started by Mr. A. G. Reynolds, at half minute intervals, and they had to complete an exceptionally sporting course at the usual schedule speed of 20 m.p.h.

At 2 p.m. the first man led the way down the Portsmouth Road, turning left up to the popular rendezvous, Newland's Corner, and then to the charming village of Shere. The first really severe test, three miles from the latter village, proved extremely difficult for the solo riders, as the thick, muddy surface of the hill, on which one half of the track it was impossible to ride, and the slippery right angle corner at the bottom, required much skill to negotiate.

Bore Hill was the next objective, whereat a very successful hill-climb was recently held by this club. Little difficulty, however, was experienced and, reminiscent of the hill-climb, many competitors made fast ascents. Allan O. Gruzelier (8 Zenith sc.) came up at speed, whilst W. G. Barker and three passengers on a Henderson sc. came up well, as also did J. A. Masters (7-9 Harley-Davidson sc.).

On the outskirts of Gomshall, R. E. Staunton (Triumph) was observed in trouble with his tyres. One or two awkward bends were encountered between Peaslake and Pitch Hill, which, rendered difficult by the greasy road surface, caused some little anxiety to solo riders.

A circular route from Ewhurst brought the riders to the last stiff hill, which, if successfully ascended, permitted them to retire to the Bull's Head Hotel, Ewhurst, and, after checking in, to enjoy well-deserved refreshment. The climb, although steep, maintained a comparatively straight course, and had a good surface.

The machines were well handled throughout the trial, and the thirty award winners merited success.

The arrowing was good, and, combined with the explanatory route cards, there was no possibility of losing the course.

Awards.

	Total error.
1. R. A. Green (3½ Norton), winner of the BUTLER CHALLENGE CUP (to be held for one year) and the CLUB GOLD MEDAL ..	1m. 44s.
2. W. B. Reeve (8 Zenith sc.), SILVER MEDAL	1m. 55s.
3. Allan O. Gruzelier (8 Zenith sc.), SILVER MEDAL	2m. 15s.

SILVER MEDALS (non-stop run and within 5m. of schedule time).—H. S. Powell (3 A.B.C.), H. F. Edwards (6 Zenith sc.), W. J. Kelly (8 Zenith), J. A. Masters (7-9 Harley-Davidson), D. H. Davidson (4 Harley-Davidson), W. R. Preston (3½ Sunbeam), H. Jepson (8 Zenith sc.), J. O. Smith (4 Norton), F. E. Salter (2¾ Zenith), H. P. Lucas (8 Zenith), P. W. White (3½ Sunbeam sc.), L. T. Gibson (6 Zenith), H. W. Barr (4¼ B.S.A. sc.), F. R. Spikins (7-9 Harley-Davidson), S. J. Dyer (7-9 Indian sc.), and M. B. Machin (8 Zenith).

BRONZE MEDALS (competitors losing less than 16 marks).—H. O. Marriott (2¾ Edmund), F. J. P. Disney (Sunbeam sc.), D. Crawford (8 Zenith), G. E. Payne (8 Zenith), C. Pressland (10 Crouch cycle car), W. G. Barker (8-10 Henderson sc.), Harry Gray, jun. (8 Zenith), Chas. W. Pugh (6-7 Abingdon sc.), J. T. Shillito (3½ Sunbeam), J. G. Bluhen (4¼ B.S.A. sc.), and Capt. R. H. Bywaters (6 A.J.S. sc.).

A SINGLE-GEARED TWO-STROKE TRIAL.

A SPORTING trial was run off on the 26th, over Midland lanes and test hills. Only single-geared Levis machines were eligible, but in spite of this, over thirty entrants were sent away by Mr. Abe Ross. The course of 82¼ miles included Koppen's Corner, Rose Hill, Beacon Hill, and Swans Hill.

No names were printed on the morning's route card, and competitors had to find their way by directions only. After lunch at the Nag's Head, a normal route card was provided. G. S. Davison, G. W. Reynolds, and G. Kuhn made star ascents of the Beacon, which is a severe climb for a single-geared lightweight, but Swans Hill proved the Waterloo of even these redoubtable riders. The surface of the hill was wet in spite of a fine spell of weather, and it is doubtful if any of the competitors had ever seen the hill before.

The remainder of the journey was comparatively easy, except that the Baldwins Lane watersplash, taken for the second time, seemed to present more difficulty than one would imagine. One suspects that some of the belt pulleys used were smaller than standard!

Some thirty riders clocked in at the finish, mostly showing "traces of wear," and nearly all late. Those who got round and averaged "20" deserve every credit; their number includes Davison, who put up a good show all day. Special mention should be made of two boys of 14 who finished, one J. G. Balshaw, who rode down from Liverpool to compete, and the other, N. D. Pickering, who rode splendidly throughout.

Racing in a Disused Army Camp.

East Midland Club's Joint Speed Trials at Clipston Park.

In the vicinity of the disused garrison theatre at Clipston Park, where competitors were busily giving the finishing touches to their engines.

MIDST a scene of desolation that must have brought home unhallowed memories of past training days to many of those present, the Mansfield and District and the East Midland Centre A.C.U. held their joint speed event. In this setting, violent in contrast to that of the recent Chatsworth meeting, the club's team trial was also decided—a trial which was to have been run at Chatsworth, but which had to be postponed. At both meetings magnificent weather prevailed, at both meetings were there ties for fastest times, but it was A.J.S. v. Norton instead of A.J.S. v. Sunbeam, as at Chatsworth.

The centre of interest was immediately focussed on H. R. Davies (A.J.S.) and G. Walker (Norton) when they clipped seconds off the previous best time for the half-mile. These two tied for the fastest time of the day, both covering the course, which was a tarred macadam road, in 23s.—nearly 80 m.p.h.

Fastest Time of the Day.

Naturally, the event of the afternoon—the re-running of this tie—was awaited with keenest interest, the partisans of each make of machine seeming to be about equal. Probably the smaller mount, however, was favoured by the ladies, who were intensely interested, and when Davies flashed over the tape once more, it was felt that he had equalled, if not bettered, his previous time of 23s. The message over the 'phone subsequently proved his time as 22s. This was too good for Walker, who failed to better his previous performance; nevertheless, his riding was exceptionally good.

There were other exhibitions of really fine riding too, several competitors almost reaching a speed of 80 m.p.h. Reg. Lucas (A.B.C.)—a favourite in the locality—rode well, and gave Petty a good run in Class 2, in which competitors rode in pairs. In this duel was seen the most sensational racing of the afternoon, for not until close on the finishing line did Petty manage to overhaul Lucas.

L. W. Forinton (Indian), E. Searle (Norton), G. S. Debenham (Brough), and H. G. Sissons (Norton) made good times and handled their machines surely and confidently, which was more than some of the competitors did.

The following were the team results:

LOUGHBOROUGH AND DISTRICT M.C.C.

1. H. R. Davies (A.J.S.) ... ... 23s.
2. Harold Petty (Norton) ... ... 24s.
3. Graham Walker (Norton) ... 23s.

LINCOLNSHIRE AUTOMOBILE CLUB.

1. L. W. Forinton (Indian ... 24½s.
2. C. T. Koehler (Norton) ... 25s.
3. L. F. Harrington (A.B.C.) ... 25s.

SHEFFIELD AND HALLAMSHIRE M.C.C.

1. E. Searle (Norton) ... ... 24⅘s.
2. G. S. Russell (Norton) ... ... 25⅕s.
3. E. Sissons (Norton) ... ... 25⅕s.

Fastest Time of the Day.—H. R. Davies (2¾ A.J.S.), 22s., winning the Lucas Challenge Cup, Lucas gold medal, gold medal fastest time for trade entrant, £5 prize best time in Loughborough team, also £3 3s. prize for winner of Handicap (Class 2).

£5 Prize for Best Performance for Nottingham Rider.—J. N. Roberts (3 A.B.C.); second prize, M. J. Wright (2¾ Douglas).

Triumph Gold Medal for Fastest Time (Private Owner).—Tie: Leslie Mitchell (3½ Norton) and Ernest Searle). Time, 24s.

Mansfield Club.—Gold medal, Reg. Lucas (3 A.B.C.); silver medal, G. Mills (7-9 D.M.C.).

Loughborough Club.—Silver cup, H. M. Barron (3½ Norton).

Class 1 (Flying Start).—Open to any type of machine, any c.c., was won by H. R. Davies (A.J.S.), Graham Walker (Norton) second, Leslie Mitchell (Norton) and E. Searle (Norton) tieing for third place. Class 2 was run off in pairs, the handicapping being arranged from times made in previous classes.

A scene at the start of the trial. This was the Mansfield club's first speed event, and was, on the whole, well organised.

CLUB NEWS.

Week-end Club Events.

Oct. 2.—Loughborough and District M.C.C. Speed Trials.
Oct. 2.—Edinburgh and District M.C. Hill-climb.
Oct. 2.—Dublin and District M.C.C. Club Run.
Oct. 2.—North London M.C.C. Novelty Event.
Oct. 2.—B.M.C.R.C. and Essex Motor Club. Brooklands Meeting.
Oct. 2.—Birmingham M.C.C. Twenty-four Hours' Run.
Oct. 2-3.—Exeter M.C. and J.C.C.. Reliability Trial.
Oct. 3.—Stalybridge and District M.C. Social and Picnic.
Oct. 3.—Reading and District M.C. and L.C.C. Run to South Stoke
Oct. 3.—N.M.C.F.U. (Portsmouth). Run to Woolmer Forrest.
Oct. 3.—North Cheshire M.C.C. Reliability Trial.
Oct. 3.—Woolwich, Plumstead and District M.C.C. Hill-climb.
Oct. 7.—Bedford and District M.C. and L.C.C. Club Run.
Oct. 7.—Southampton and District M.C. Reliability Trial.
Oct. 7.—Norwich and District M.C. Whist Drive.

North London M.C.C.

W. D. Smith (4 Indian Scout) was adjudged the winner in the recent vice-captain's surprise event. J. D. Timmins, mounted on a 1 h.p. scooter of his own design, evoked much interest. The novelty competition for the three prizes offered by the Dollis Auto Co., of Church End, Finchley, will take place on October 2nd.

Southampton and District M.C.

The Southampton and District M.C. held a very successful hill-climb at West Dean Hill, Hants, on September 18th. There were twenty-five entries, and the special prize for fastest time of the day went to Mr. R. A. Beazley (7-9 Indian).

The results on formula are as follows:

CLASS 1 (Solo Machines).—1, L. A. Apsey (3 A.B.C.); 2, F. H. Burnett (3 A.B.C.); 3, A. S. Burnett (2¼ Velocette).

CLASS 2 (Sidecar Machines).—1, H. Dale (8 Royal Ruby sc.); 2, L. A. Apsey (8 Royal Ruby sc.); 3, L. J. Dawe (4 Triumph sc.).

Bristol Sports Club.

The motor section of this club held their one day reliability trial on September 19th for the Club Challenge Vase and gold medals. The route chosen was over a fairly stiff course to Broadway in Worcester. Less than half the competitors arrived within the time limit allowed. The following obtained gold medals: 1, (Club Challenge Vase and gold medal), G. Powlesland (3¾ Scott sc.); 2, (tied) Percy Gibbs (4 Harley-Davidson Sports) and A. W. Dyer (4 Douglas sc.); 3, A. W. Spencer (3½ Alecto); novice prize, W. Oram (5-6 Clyno sc.).

Dewsbury and District M.C.C.

The above club held its eighty miles reliability trial for the "Chadwick Rose Bowl" on September 18th. There were seventeen entries, eleven of whom faced the starter. Holme Moss and Chapeltown were observed hills, and although the surface was wet every competitor but one made clean climbs. The following are the provisional results: 1, R. Halliday (3½ P. and M.), lost one mark (winner of the Chadwick Rose Bowl); 2, A. E. Oates (4 Triumph), lost two marks (Scargill gold medal); 3, C. Raynor (4 Triumph), lost three marks (Ramsden silver medal); 4, T. F. Groocock (4 Triumph), lost three and a half marks (Gutteridge special prize).

Luton and South Beds A.C.

A hill-climb will be held on the 9th October, classes for all types of motor cycles being included. A special prize for the fastest time of the day will be given, other awards (depending upon the number of entries received) being given on the results of the formula $\frac{C \times T^2}{W}$

Competitors will be weighed in at Wendover Station not later than 1 p.m., and all entries must be received not later than first post on Wednesday, 5th October. Anyone joining the club now will be entitled to all 1921 privileges. Particulars of the hill-climb, together with entry form of the club, may be obtained from the trials hon. secretary, J. Simpson, 440, Hitchin Road, Luton, or the hon. secretary, G. S. Davison, 16, Bute Street, Luton.

Stourbridge M.C.C.

A sporting half-day reliability trial will be held on Saturday, October 2nd, starting from the headquarters at 2.30 p.m., over a circular course of twenty miles, to be covered twice, non-stop. Particulars and entry forms are now available from the hon. secretary, 111, High Street, Stourbridge.

Widnes M.C.

The above club held its first annual reliability trial on September 19th over a twenty miles course, covering it three times, for the Blake Cup presented by Messrs. J. Blake and Co., Liverpool.

Results: 1 (winner of Blake Cup), H. Fletcher (4 Triumph); 2, W. Cook (4 Triumph); 3, A. J. Bailey (4 Norton sc.); and 4, E. Schofield (8 Enfield sc.).

Birmingham M.C.C.

Gold medals were awarded to the following in the recent hill-climb on Stile Cop: G. S. Boston (nine gold medals); R. E. Pugh (four), G. W. Walker (four), G. Dance (two), J. E. Chamberlain (one), G. J. Baragwanath (one), L. D. Cuxson (one), and G. E. Stobart (one).

The Birmingham Motor Cycle Club are to be congratulated on the success which attended their initial effort at a gymkhana. Had the weather been fine there is no doubt that the attendance would have broken all records as far as motor cycle gymkhanas are concerned; even as it was there was a very gratifying attendance, and an excellent entry of over one hundred for the various events. The spectators thoroughly enjoyed the afternoon's sport. The competitors themselves seemed to get most enjoyment from the musical chairs, although the cigarette lighting race was very amusing, and none of the events could be termed dull. There were some valuable awards, presented by members and friends of the club, and the entire proceeds of the event went to the *Birmingham Daily Mail* Christmas Tree Fund.

IMPORTANT DATES.

Sat., Oct. 9th—
M.C. and A.C. Open Reliability Trial.

Nov. 29th.-Dec. 4th—
Olympia Motor Cycle Show.

Barnsley and District M.C.C.

Nearly 1,000 spectators witnessed the recent fast and slow hill climb at Stainborough Low. The results were as follows:

UNLIMITED SIDECARS.—1, T. Barnes (6 New Imperial sc.), 54s.; 2, M. Curtis (7-9 Indian sc.), 69⅘s.

350 c.c. SOLO.—1, A. Campy (2¾ Wooler), 64⅘s.; 2, P. Hall (2¾ Douglas).

600 c.c. SOLO.—1, M. Carter (3½ Norton), 40⅘s.; 2, C. E. Reynolds (3 A.B.C.).

1,000 c.c. SOLO.—1, T. Barnes (6 New Imperial), 38⅘s.; 2, M. Carter (7-9 Indian), 43⅘s.

SLOW CLIMB.—1, B. Richard (4 Triumph); 2, M. Carter (7-9 Indian).

Berwick and District M.C.

Berwick and District Motor Club held its speed trials on Belford Moor on September 19th. There was an entry of forty, and a large number of spectators attended. W. Murray won the gold medal for the best performance of the day. Results:

CLASS 1 (Unlimited Sidecars).—1, Capt. Cumming (7-9 Harley-Davidson), 29⅘s.; 2, T. Lilburn (6 James), 24s.; 3, A. Redpath (6 A.J.S.), 25⅘s.

CLASS 2 (500 c.c.).—1, W. Murray (3½ Sunbeam), 18⅘s.; 2, J. Ayre (3½ Rover), 21⅘s.; 3, T. Smart (3½ Rover), 21⅘s.

CLASS 3 (650 c.c.).—1, W. Murray (3½ Sunbeam), 17⅘s.; 2, J. Ayre (3½ Rover), 20⅘s.; 3, A. Buglass (4 Triumph), 22⅘s.

CLASS 4 (1,000 c.c.).—1, W. Murray (3½ Sunbeam), 17⅘s.; 2, Capt. Cumming (7-9 Harley-Davidson), 18s.; 3, J. Ayre (3½ Rover), 20s.

CLASS 5 (350 c.c.).—1, A. Ritch (2¾ Douglas), 27⅘s.; 2, Miss Bates (Auto-Glider), 37s.

Westmorland M.C.C.

Practically all the leading clubs of the North now include the famous Kirkstone Pass in their season's programme, and it was hardly to be expected that the local club would forsake it, for the Westmorland Club has won a reputation in the district for leaving no climb alone which is at all negotiable. There was an exceptionally large attendance of the general public on the Pass on Saturday when the club held its flexibility trials. The surface was in very good condition, and all the competitors accomplished the fast climb well, but the slow ascent caused three solo riders to fail. The awards were as follows: 1, R. Harrison (Indian); 2, B. Braithwaite (Braithwaite); 3, H. Wills (Norton). The sidecar class provided W. D. Stewart (Indian sc.) with a walk-over.

Newcastle and District M.C.

The Newcastle and District M.C.'s "knock-out hill climb" near Rothbury, on 19th September, proved so successful that it has been decided to repeat the event—weather permitting—on October 2nd. Competitors were despatched in pairs, abreast, having been first separated into capacity classes, and there were some very exciting contests. The roads were dry and crisp, and consequently safe, and the event was free from mishaps. Thirty-two started, and three out of the four winners were amateurs. The results were as follow: 350 c.c. solo, Dawson Hall (2¾ Verus); sidecar class, J. L. Travers and C. Armstrong (both on 7-9 Harley Davidson machines), divided the honours; unlimited solo class, C. Webb (4 Norton).

The Newcastle and District M.C. is arranging a fixture list for the winter, which includes a dinner on October 27th, a ball, two whist drives, several lectures, musical evenings, impromptu discussions, etc., and one or two fault-finding competitions. If any general desire exists, a mid-winter trial will be organised.

More than

10,000

MOTOR CYCLISTS IN THIS COUNTRY ARE USING THE

SHALER

5-MINUTE VULCANIZER

There is a reason for this:

The Shaler repairs tube punctures in the only *permanent* way—by vulcanizing. The method is simplicity itself. You clamp a repair unit over the damaged part, light the fuel, and the Shaler does the rest. The resultant repair is no make-shift patch—it is every bit as strong as any other part of the tube

With 12 patch and heat units. Price **10/6**

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/—, and 3d. for every additional word. Paragraphs—of under 8 words re charged double rate. Each paragraph is harged separately. Name and address must e counted. Series discounts, conditions, and pecial terms to regular trade advertisers will e quoted on application.

Postal Orders and Cheques sent in payment for dvertisements should be made payable ILIFFE & SONS Ltd., and crossed & Co. reasury Notes, being untraceable if lost in ransit, should not be sent as remittances.

All advertisements in this section should be ecompanied with remittance, and be addressed o the offices of "The Motor Cycle," 20, Tudor treet, London, E.C.4, or 19, Hertford Street, oventry. To ensure insertion letters should e posted in time to reach the offices of "The lotor Cycle," by the first post on Friday orning previous to the day of issue.

All letters relating to advertisements should uote the number which is printed at the end of ach advertisement, and the date of the issue which it appeared.

The proprietors are not responsible for clerical r printers' errors, although every care is taken o avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be ddressed to numbers at "The Motor Cycle" Office. hen this is desired, the sum of 6d. to defray the cost of gistration and to cover postage on replies must be added the advertisement charge, which must include the ords Box 000, c/o "The Motor Cycle." Only the number ill appear in the advertisement. All replies should be ddressed No. 000, c/o "Motor Cycle," 20, Tudor Street, .C.4. *Replies to Box Number advertisements containing mittances should be sent by registered post, but in all such ses it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box mber, as it is unusual for these to be sold without first ing inspected by the intending purchaser, advertisers will ciliate business by embodying in their advertisements me mention of the district in which the machine fered may be seen and tried.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons ay deal in perfect safety by availing themselves of our eposit System. If the money be deposited with "The otor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the ods is three days, and if a sale is effected we remit the mount to the seller, but, if not, we return the amount the depositor, and each party to the transaction pays rriage one way. For all transactions up to £10, a eposit fee of 1/- is charged; on transactions over £10 d under £50, the fee is 2/6; over £50 and under £75, 5/-; er £75 and under £100, 7/6; and on all transactions er £100, ½ %. All deposit matters are dealt with at , Tudor Street, London, E.C.4, and cheques and money ders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an dication that the advertiser is willing to avail himself of e Deposit System. Other advertisers may be equally sirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no swer to their enquiries are requested to regard the ence as an indication that the goods advertised have ready been disposed of. Advertisers often receive so any enquiries that it is quite impossible to reply to ch one by post.

USTIKON HEELS are manufactured from the same excellent and durable rubber mixing that has made the Ustikon Sole unrivalled. They are fixed in the same simple manner.

Ustikon heels fit flat to the edge of the heel of the boot, leaving no unsightly gaps like ordinary rubber heels, thus preserving the leather.

Ustikon heels supply a long felt want in the simple and effective repair of all kinds of plimsolls, rubber boots and shoes, as well as leather.

Making Headway.

WE make no apology for reverting to the subject of power alcohol, since it is one of the most vital questions affecting the future of the present-day motor cyclist. So long ago as 1900 our sister journal, *The Autocar*, was drawing attention to the possibilities of alcohol as a power producer, and our campaign has been carried on with increasing energy as the need for a petrol substitute has grown with the development and increasing importance of road transport.

After many years the Government appear at last to be taking a certain amount of interest in the question, though they cannot be accused of undue haste in the matter. It is, however, a hopeful sign that a suitable denaturant is being sought, and that legislative measures for the removal of certain restrictions are being inaugurated.

It is, perhaps, necessary to remind our readers that there are many aspects which require careful consideration, since alcohol alone is not an entirely suitable fuel, and a proportion of petrol or benzole must be added in order to provide reasonable running with engines of normal design. This, however, is a difficulty that is easy of solution, and the main question before us at the present time is the production of a source of motive power within the limits of our empire. Power alcohol provides the obvious answer, as the necessary amount of benzole or shale oil can be produced at home, and in addition to this a modified form of power unit will come into being as soon as alcohol fuel is available in sufficient quantities to make the modifications worth while.

Other countries, particularly Germany and Austria, have given much attention and Government assistance to the home production of alcohol. It remains for us to profit by their experience, and to make up the leeway already lost. Advantage of this beginning must be taken *at once*.

Cinema Revelations.

THERE is scarcely a motor cycle manufacturer who cannot learn something about the behaviour of his product from a cinema film of a severe trial. Such films are in existence, and are most interesting to watch. Indeed, after a little study, it is possible to recognise some makes of spring fork by the behaviour of the machine on the road before the forks themselves are distinguishable in the picture.

It is one thing to witness such films projected on a screen at a normal speed, and quite another to set the pace in order that it may more clearly be seen what really happens to such parts as spring forks and spring frames under various conditions.

The ultra rapid lens, exploited with most entertaining results by one of the leading film producers, shows us how a man jumps or dives or plays tennis; it reveals to students of aeronautics how a bird flies. What would be more interesting to motor cyclists would be a film showing machines of different types climbing such hills as Park Rash or Harden Bank. We know that such a film would surprise makers of some machines, and show the advantages and disadvantages of various types of forks. Saddle comfort is another point which could be improved by the use of the cinema, and it is not too much to expect that even shock absorbers could be investigated by these means. Since the comfort of the rider is such an important point, we would commend the idea to manufacturers and to the recently formed Research Association, as it should prove a most instructive and interesting lesson.

Cinema study of complex or extremely rapid mechanical motions is not entirely new, of course, for several forms of apparatus have been evolved for the direct observation of such phenomena as poppet valve bouncing; the action of contact breaker rocker arms has also been studied in the same way.

An index to the advertisements in this issue will be found on the page facing the back cover.

Occasional Comments

BY IXION

The Go-anywhere Lightweight.

ONE of our contributors recently suggested that the A.C.U. Trials should in future be subdivided into "home" and "colonial" sections, certain types of machine being relieved from the necessity of tackling goat tracks and precipices. The grounds for this suggestion were reasonable enough. Colonial service demands a heavier and lower-geared machine than is requisite for ordinary British touring. Our contributor went on to hint that lightweights and sidecars should be excused from traversing the "colonial" sections by going round another way, as did the sidecars in the 1914 Six Days. Here he was on dangerous ground. Many firms in the trade hold that the Overseas users include many men who want sturdy sidecars and good lightweights. Past orders certainly justify this view; and the excellent showing put up by machines of both types in 1920 confirm the contention. It may be true that at present very few British lightweights go abroad; but the Velocette achievement in the Six Days has excited keen interest in foreign markets, and with a little push and propaganda there is no valid reason why a big export trade in first-class lightweights should not be built up.

A Case in Point.

ONLY the other week I entertained a couple of Rhodesians at my house, both of whom went so far as to say that the so-called "baby" was infinitely the most suitable motor cycle for their particular jobs. In parts of that colony fords and bridges are common, and the bridges are often out of repair, or even missing altogether. Pushing a machine through the water is only a preliminary to lifting it up a practically vertical bank on the further side. Man-handling a heavyweight in tropical temperatures is obviously an impracticable proposition. So one of my guests uses a Baby Triumph, and the other a Douglas. The manner in which the Velocette team defeated the bulk of the high-powered trade team entries was for them the chief feature of the 1920 Six Days. It follows that any subdivision of a Six Days entry into "home" and "colonial" sections should extend to each class, since the colonial lightweight is neither impossible nor undesirable.

Who is Right?

THIS leads me on to ask whether a lightweight or a heavyweight solo 'bus is the easier to manage on a hill like Park Rash? I have heard very contradictory opinions on this topic, and they were all reflected in the press reports of the Six Days. For example, "Pa" Applebee told me that he envied the heavy outfits. Mrs. Knowles, who rode a heavyish mount, told me she envied the men, whose extra weight, in her opinion, steadied their machines wonderfully. On the other hand, one report stated that riders of the lightweights obviously had an easier task on the freak hills than their brethren on the big machines. Personally, I prefer a heavy 'bus on a freak hill.

Pax, Norton!

TECHNICALLY, I quite agree with Mr. Norton when he argues that a first-class reputation for speed can only be based upon reliability of a very high order, since speed is an infallible detective of any weaknesses. At the same time the paragraph which provoked his pen to a counter-strafe was not so unsound as he would make out. Every motor cycle designer builds machines for use, just as every *chef* creates dishes to be devoured. But an *entrée* is not a joint, and the B.S.A. and the Norton are not designed with identically the same motive. I daresay both designers would love to monopolise the entire motor cycling market; but surely they have divers methods of setting about it?

Motor Cycling in Japan.

I HAVE just had a long screed from a Bradbury enthusiast in Japan. Motor cycling is a patient game out there. You commence operations by paying a professional letter-writer to compose two flowery chits to the police, informing them what a fine driver you are, and what a safe 'bus you propose to drive. In three months or so, if you are lucky, you are summoned to the police station, when you demonstrate your skill with an official in the sidecar. Finally, after fitting a Klaxon and a speedometer, you are allowed to take the road with your 'bus disfigured by two colossal number placards, the index letter being from the Chinese alphabet; the sample sent to me appears to represent a house built of playing-cards collapsing during the first spasm of an earthquake.

They Must Not Die!

THE voluntary liquidation of the Sopwith concern has come as a great blow to me. I was in a sense the first member of the general public to "discover" the original A.B.C. bicycle, and to recognise the unique merits of its sprung frame and revvy engine. One of my most eager dreams was to own the 150 lb. two-speed T.T. model, which Mr. Bradshaw was busy on in 1915, and which the war rendered stillborn. Then came the little post-war 3 h.p. which was unquestionably *the* centre of interest at last Olympia, and promised just about to top the solo class as soon as ripe experience had perfected its infantile promise. Then the ruthless financial conditions of the times intervened, and a charming 'bus must remain for the nonce in a state of suspended animation. However, the patents and the design remain; and when easier days come along, some wise financier will surely resurrect it. I cannot write of the Clyno with the same intimacy, for I have never been a sidecarist or a big twin man; but I suppose that an even greater number of enthusiasts hope that its demise, too, is merely temporary.

The Foot Change.

THE above mention of the stillborn 1915 A.B.C. speedster reminds me of a very sound principle which Granville Bradshaw enunciates where ultra-fast machines are concerned. The gear change in his opinion must be done by the foot. I would go further, and say that a foot gear change is desirable in all modern competition work. Neither in the T.T., nor in a hill-climb, nor in a reliability trial up a long, step-ladder hill such as White Shaw Moss, is it desirable to remove a hand from the steering bar, even for the fraction of a second. At present the Scott is the only machine on the market designed for a pedal gear-change, though one or two babies have handle-bar gear levers (*e.g.*, the Triumph and Beardmore). It is, of course, very difficult to devise a foot change for the three-speed gears which are necessarily standard behind most engines; but what an asset a foot-change would be in the next T.T. if the whole trade goes bald-headed for the trophies, and the pace is a real cracker with a dozen top-notchers lasting the whole course at full speed!

Watch the Cycle Car.

WHAT with coal strikes and tight money and other disagreeables, nobody quite knows how the immediate future of the motor industry may shape itself. But—given a clean run—it is already obvious that the cycle car is ripening towards something of a boom. In the old days, the cycle car was between the devil and the deep sea. When a big, lavishly equipped bicycle *sans* sidecar cost you about £100, and the meaner sorts of light car were procurable at round about £150, the unfortunate cycle car could only makes its push on a very narrow financial front, and it never had much chance of a decisive break through. To-day, £250 is about top price for a sidecar outfit *de luxe*, but you have to double that figure "and then some" before you can get a small car. This price gap gives the cycle car a roomy corner to stretch itself in and, incidentally, weans a good many small car people from their old hobby. Hence glorious prospects open before our old friends—the G.N., the Morgan, and others of that ilk; and every week brings news of some new cycle car emerging from its experimental stage. For instance, J. F. Buckingham has abandoned incendiary bullets, and may be seen in the Midlands at the wheel of a projectile which threatens to achieve the incredible and extend the racing G.N. "Kim" in next year's hill-climbs. There ought to be a fine range of light three and four-wheelers abroad by this time next year, if Messrs. Smillie and Chamberlain give us half a chance.

THE WATERSPLASH WHICH WAS INCLUDED IN A TWO-STROKE TRIAL IN LEICESTERSHIRE.

It does not look very difficult, but at a steep bank a few yards further on fully fifty per cent. of the competitors in the Leicester Two-stroke Trial failed through belt slip. P. J. Strong (2½ Han San), the rider shown, does not appear to be so happy as the spectators, who include Mr. Bowerman, the donor of the cup (on the extreme left).

A DREAM THAT CAME TRUE.

The Chronicle of a Thousand Mile Ride Home from Italy.

DESOLATION. A road in one of the devastated regions of France.

IT became obvious that my services would no longer be required in Italy, and at last I should be able to take my final journey homewards from the war. One's dreams seldom come true, and the vision of a public reception at Victoria Station with a brass band and all the accessories which the humourist of 1915 used to beguile us with seemed rather remote, but I determined that the final journey homewards should be one to be remembered. I was looking at the old 'bus one morning, when the great dream was born, and from that moment, all my spare time was devoted to the most minute preparations to make it come true. I had been riding a Triumph solo machine for a few months, and I had grown attached to it. So I determined to secure the machine, and then proceed home from Italy by road, either through France, or Switzerland, or both. After a few weeks of persuasion the Disposals Board handed me a Sales Note and my steed.

When the mud was removed, and I really saw the Triumph for the first time, it proved to be the usual W.D. pattern, with a number well over 50,000, and with the usual minor alterations that those enterprising lads, the despatch riders, used to perpetrate on their mounts. But there was no doubt about the fact that the old 'bus was a most reliable bit of mechanism, and I began to hope that it would carry me safely home without any real trouble.

Preparing the Machine.

Then the work began—tuning, cleaning, fitting, until the most critical expert had naught but praise to give. My stable companion, who lived in the other half of our tin hut, said he would never share a hut with a motor cyclist again. It was bad enough to sleep with a man who snored, but that would be perfect peace compared to a brute who started up an engine in the wee sma' hours of the morning.

However, the day arrived at last, and with it the rain. Everything was ready, a despatch rider's box on the carrier, two leather veterinary bags in place of the usual tool bags (one carrying tools, and the other spares), and a few personal odds and ends, such as pyjamas, etc., in a pair of ordinary saddle bags slung under the seat and strapped on each side of the back forks. These, with a spare belt round the tank and a spare tube in front, completed the outfit. The old 'bus looked quite skittish, and at the last moment I decided to discard my spare cover and trust to the two extra heavy Dunlops to see me through. Altogether I had about 75 lb. weight on board beside myself. Finally, I waved a "Cheerio" to the Mess, and the dream began to come true. I had a thousand miles to do within ten days; alone and in all weathers, and only a war-worn Triumph to do it on.

In the Mountains.

I decided to take the road down the Riviera as far as Marseilles, and then right across France to Calais. The first hour was good going. Arquata soon was lost sight of, and Novi came in sight, and then I began to have trouble. I had just turned into the mountain road that leads to Acqui and thence over the mountains to Savona, when it began to rain, and the next forty miles were the worst of the whole trip. I was soon enveloped in a thick rain mist, with roads thick with mud and in some places almost unrideable. Oxen slowly drawing cartloads of wood drove one off the narrow road into the ditch, and I wished myself back in the old tin hut again.

So for four weary rain-sodden hours I swam along those horrible roads, with the only comfort that the engine was ticking like a clock, until at last I dropped down the other side of the mountains to the famous Riviera road. The miracle happened within two minutes! I was playing tricks on a perfectly atrocious road one minute, with a thick, impenetrable mist all round, and the next the road was perfectly dry, the mist had vanished, the sky was blue, and I sailed on into brilliant sunshine, with the air fragrant with the scents of mimosa and apple-blossom. The contrast was quite indescribable.

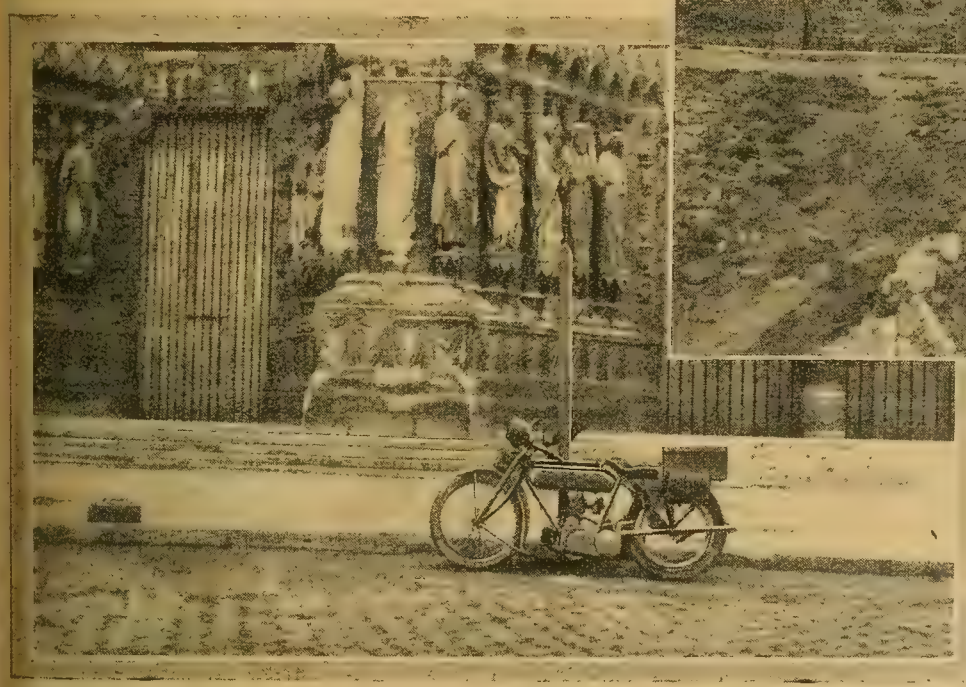
A Dream that Came True.—

Then things began to hum, and through the tunnelled arches of the Riviera road, past Savona and Alassio, and along through orange-laden groves, with the blue Mediterranean less than fifty yards away, the dream had changed from a horrible nightmare to a dream of delight.

Passing through San Remo, I soon reached Bordighera, where old Matteo at the Hotel de la Reine soon pulled me out of my overalls, and sat me down to a jolly good feed. So ended the first day, with 120 miles to the good.

Over the French Border.

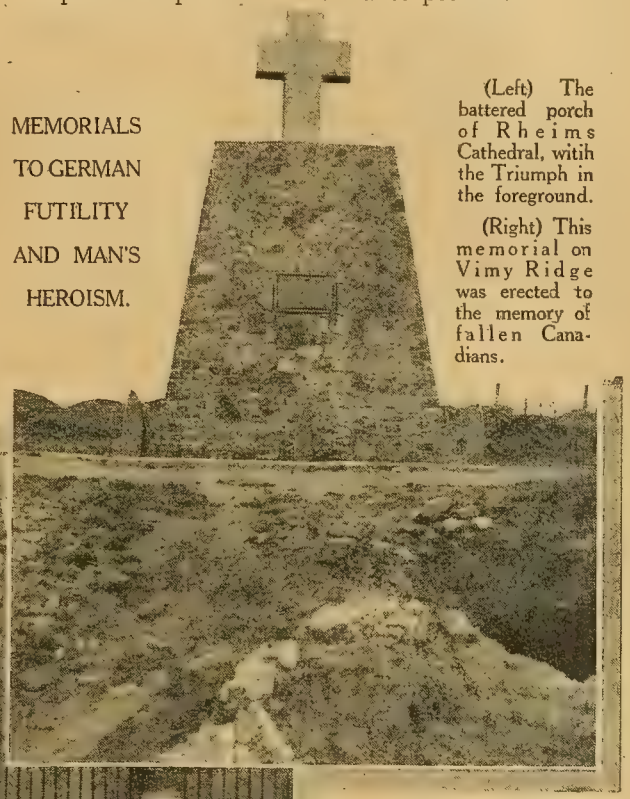
Next morning, after oiling up, and tightening a couple of nuts on the front forks, I set off to cross the frontier, and hie me away to sunny France. The *gendarme* at the frontier *halte* looked at all my papers, discovered I was an *officier Anglais*, inspected the 'bus to see that it was the machine referred to in my papers, and finally waved his hand in lordly dismissal, and the realm of France lay at my feet.



Mentone was soon left, and the old 'bus plugged away steadily on top gear up the high road to Nice, as if gradients suited it nicely, and in a short time I was looking down from the heights on Monte Carlo and Monaco, nestling side by side on the fringe of a deep blue sea. Then came Nice, and an English chauffeur directed me along the Promenade des Anglaises and so on to the Cannes road. I took his advice, and was promptly pulled up by a *gendarme*, who would neither let me go on nor turn round, so I put the machine on the stand, and found I had run into a "battle of flowers." It was a most gorgeous sight, and some of the fair ladies seemed to think that a begoggled motor cyclist was a fair target.

I had heard such tales of the difficulty of getting petrol that I expected to have considerable trouble, but, after calling at one or two garages, I struck petrol at Cagnes. A jolly old madame provided me with five litres at a charge of two francs per litre, and quite good juice it was. A Triumph tank holds about eight litres, so at the present exchange it works out about 4s. per gallon, which is not really out of the way. It was always possible to get petrol, and with one exception the price was two francs per litre.

MEMORIALS TO GERMAN FUTILITY AND MAN'S HEROISM.



(Left) The battered porch of Rheims Cathedral, with the Triumph in the foreground.

(Right) This memorial on Vimy Ridge was erected to the memory of fallen Canadians.

The roads onwards from Cannes were glorious, and I kept up about 24 m.p.h. through Antibes and Fréjus until Brignoles was reached about 7 p.m. A few signboards showed me that I had struck the trail of the Paris-Nice trial, and until reaching Dijon I travelled in the tracks of those persevering supermen who did the Paris-Nice in four days at a rate of thirty kilometres per hour. Thirty kilometres per hour don't seem very much, so I registered a vow that I would knock spots off those Paris-Nice fellows, and I did—for about three hours. Then I drew near to Avignon, and was sorry I spoke. The roads became absolutely horrible.

For stretches of ten miles or so at a time they were not roads at all; they were infintely worse than anything I had seen in the battle areas in France. The surface had completely gone, and the road resembled an exaggerated nutmeg grater, made up of pot-holes up to a foot deep. My back nearly broke, and after about fifty miles more of the Rhône Valley I was only too glad to take shelter for the night at Montélimar.

A Dream that Came True.—

Over dinner I worked out the average for the day, and found it was about twenty-four kilometres per hour! I do not intend taking up competition riding!

The Rhône Valley certainly was atrocious, and I hurried on as fast as the roads would permit. I spent a night at Lyons, and another at the charming Hotel de la Poste, at Beaune, at which I arrived after nine hours' gruelling ride in the rain.

On the Western Front.

Next night saw me at Troyes, after a day's run over passable roads and in fairly comfortable weather. At Troyes the real adventure began, for I left the Paris road on my left, and said "Good-bye" to the comforting signs of the Paris-Nice trial. A short run brought me to Châlons-sur-Marne, and from this point onwards I followed the windings and wanderings of the old French and British fronts. Rheims was a terrible spectacle, more devastated than any large city I had seen, and at present looks more like a modern Klondyke than a stately city of France. Very few collars are being worn in Rheims; even the people seem to have caught the Klondyke fashion.

On to Laon, over moderate roads, on which, however, I was able to keep going at about 20 m.p.h., through country that surely must have been the original of Macbeth's "blasted heath," miles and miles without a house to be seen, over roads that are flanked by the gaunt sentinels of shattered trees, and a deadly stillness over it all. The roads, however, were exceedingly good all through the war area, both French and British.

The seventh night I stayed at La Fère. The morning of the eighth day saw me near to the old British front, and the question of miles per hour was displaced by the question of photographs per hour. A thick rain-mist covered the whole landscape, and I felt sorely disappointed, but I shielded my lens from the rain, and proceeded according to plan, and I find I have about forty good films as a souvenir of the trip.

From Bray, of 1916 fame, I passed on to Meaulte, where I spent a lively month before the July, 1916, show. But Meaulte is no more; it is absolutely wiped out. A few minutes up the newly-made road to Fricourt brought me to where the 1st Lincolns went over on the 1st July, 1916. Then over a real war road, past the Bois de Mametz, with shell-holes in the middle of the road, just as in the old days. But, in fairness to fact, I ought to say that the road was fenced off by barbed wire to prevent traffic, but I managed to get the old 'bus through. It wasn't fair to the machine to put it over such a steeplechase course after nearly 900 miles, but it made never a murmur, and I was devoutly thankful when I struck the good roads again at Bazentin-le-Petit. Here my luck was in, for in the distance I saw a khaki-clad Tommy carrying a dixie of tea. That man will never know how near he came to being robbed with violence, but I mastered my emotion, and merely asked him where the officers' mess was, and in a few minutes I was in a ripping little mess, with a cheery fire, with toast and ration butter, and buckets of tea. It was with great reluctance I pulled myself away. On through Bapaume to Arras, where a comfortable bed was discovered—a *rara avis* in Arras—in the new hotel of "England and the Dominions," where mine host is a demobbed British soldier. Here I was chased by an alert A.P.M. and two of his myrmidons for being in possession of an Army cycle, but I was able to satisfy their curiosity.

The last day began with Vimy Ridge, where the Canadian Memorial Cross dominates that desolate area, through Lens and Loos, Bethune and St. Omer, and, after a burst of speed between Bethune and Calais, when I did the eighty-four kilometres in an hour and threequarters, I wheeled the old 'bus down the gangway of the "boat that was bound for Blighty." So the dream came true. Just about a thousand miles in eight and a half days, and I could have done it in six.

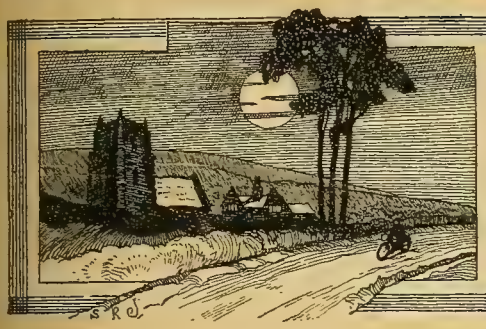
The roads in the war area were exceedingly good, thanks to the work of prisoners of war, but the road in the Rhône Valley remains as a horrible dream.

A No-trouble Machine.

The engine was not touched by a spanner from start to finish, and I replaced nothing save the belt. Most of the nuts on the front fork loosened at one time or another, but beyond that I did not touch the mechanism during the whole trip. I knew it was a good 'bus to start with, and I oiled it at regular intervals, and on reaching England I found that it would not be necessary to take the engine down for quite a while.

STANLEY H. KEEN.

ON THE SHORES OF ULLSWATER WITH AN INDIAN SIDECAR. The St. Martin's summer of this year has been fully appreciated by motor cyclists, many of whom have been further afield at week ends than usual. The English Lakes—at their best when the leaves are changing—have been visited by hundreds of motor cyclists during the past few weeks.



FUEL ECONOMY.

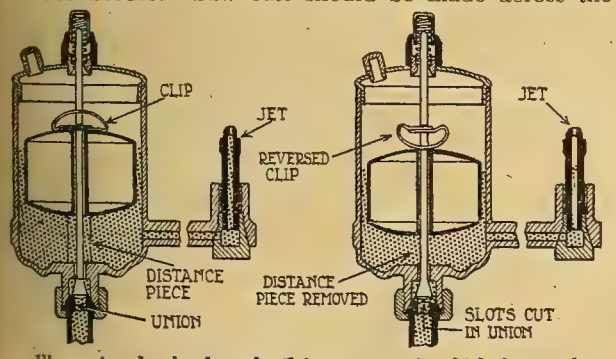
Some Simple Hints to Increase M.P.G.

Now that the price of petrol is increased and higher taxation imminent, any suggestions which will enable motor cyclists to obtain an increased mileage per gallon will no doubt be welcome. The saving in the petrol bill which can be effected by careful attention to the following details is remarkable.

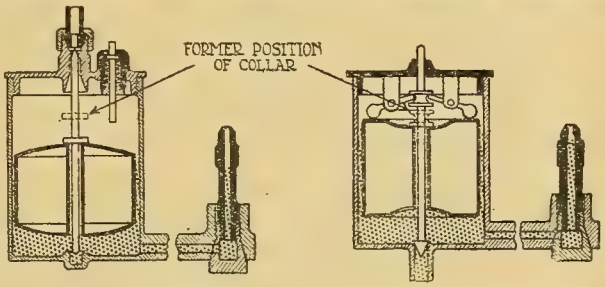
THE mere fact that petrol cannot actually be seen dripping from a tap or union is no proof that a leakage does not exist. It must be borne in mind that petrol evaporates rapidly when in contact with the air, and, therefore, a continuous "ooze" of the now precious liquid may easily escape notice. The time spent in carefully examining each union, tap, and joint for the slightest leak is well repaid. Many taps leak after a short time, while when a union joint is remade after carburetter adjustments the pipe is often bent, thus preventing the two coned portions of the union from registering correctly. Close examination of the seams and angles of the tank will often reveal slight leakages, especially in machines which have a considerable mileage to their credit. Carburetters themselves are great offenders, extensive leakages often taking place round the base of the jet. "Tickling" should be avoided—the habit of violently agitating the float until the petrol pours out is wasteful, harmful, and unnecessary. The vast majority of machines will start readily without tickling, if the petrol is turned on for, say, thirty seconds before an attempt is made to run the engine. Should tickling be really necessary, the needle should be merely held up (or the tickler depressed) for, say, five seconds, without allowing the petrol actually to overflow. In several modern carburetters no provision is made for tickling; this shows that it is unnecessary.

Petrol Level and Jets.

Manufacturers often adjust the petrol level higher than is absolutely necessary, and experiments in this direction will often have a considerable effect in reducing the fuel bill. In the case of the Senspray carburetter the level may be quickly and easily lowered by merely removing the brass distance piece from under the float and reversing the locating clip on the needle. Saw cuts should be made across the top of the inner portion of the union which is on the end of the petrol pipe, in order to prevent the flow of petrol being cut off by the bottom of the needle, which might otherwise stick in the orifice of the union. A glance at the sketch will show how this adjustment may be carried out. In several other makes it will be necessary to move the collar which is mounted on the needle—down slightly in those instances where the feed and needle valve seating is at the top, up slightly where the needle valve seating is at the bottom and the conventional system of balance weights fitted in the lid of the float chamber. In machines which have been running for some time there is usually a certain degree of wear in the needle valve and seating—this necessitates the float travelling higher before it cuts off the petrol supply, a considerably higher petrol level than the original setting being the inevitable result.



Illustrating the simple and efficient manner in which the petrol level can be lowered in the Senspray carburetter.



In the types illustrated above, the collar must be moved as indicated, *i.e.*, further away from the point, in order to obtain a lower petrol level.

It is usually possible to replace the original jet by one appreciably smaller without seriously impairing the efficiency of the engine. If no spare jets are available with which to experiment, a good "tip" is to clean the top of the old jet and then fill up the orifice with solder. One of the smaller sizes of watchmakers' taper broaches should be obtained, and the *smallest possible* hole made through the solder. This should be tried and the size of the hole gradually increased until satisfactory results are obtained. These broaches, being tapered, can be used for determining the relative sizes of jets by simply inserting the broach lightly into the orifice and measuring the distance which actually enters, the longer the measurement the larger will be the hole.

A long air intake pipe fitted to the carburetter will also prevent waste by catching any petrol which may be blown back. In engines with any degree of valve overlap, and in many two-strokes, the amount of waste from this cause is considerable.

Fuel Economy.—

In new machines of repute, ignition and valve timing can hardly be improved for general purposes, but in old machines it is as well carefully to check them, owing to the probability that wear in the valve operating gear will have caused a considerable variation from the original setting. The correct setting can be obtained from the manufacturers, and once obtained it is an easy matter to verify these points. The silencer should be examined, as it may be more or less clogged, in which case excessive back pressure will be set up.

Another great power and, therefore, fuel absorber, is friction—indeed, much more power is wasted in overcoming this than is commonly supposed. The machine should be placed on its stands and tests made for excessive friction in hubs, transmission, etc. The alignment of chain sprockets or belt pulleys must be correct, the wheels of the machine must be in track, and, in the case of a sidecar, care should be taken to ascertain that the sidecar wheel is parallel to the track of the motor cycle. Tyres should be hard; if slack, excessive friction is set up owing to the movement in the walls of the cover.

Running.

The load to be carried should be carefully considered, also the gradients to be encountered; gear ratio should be no higher than is consistent with satisfactory running. Advanced ignition, without distressing the engine, and a moderate speed are also important factors in economical motor cycling. "Blinding" is generally acknowledged to be extremely fascinating, but it is not conducive to good m.p.g. or low running expenses. An inefficient engine is usually extravagant, therefore good "tune" should be maintained. Taken separately, the points enumerated may appear almost trivial, but in the aggregate they affect the petrol consumption to an enormous degree.

REKAL.

POTATOES AND THE FUEL QUESTION.

Some Remarks on One Kind of Power Alcohol mentioned as the Fuel of the Future.

A CONSIDERABLE amount of attention is being devoted at the present time to the possibilities of alcohol as a fuel, and it seems to be assumed by many people that all that is necessary to smash the petrol combine is that the Government should remove all restrictions imposed by the Revenue on the production of this commodity.

There is no doubt that, if some of the disabilities at present imposed on distillers by the Excise authorities were removed, there would be a cheapening of the market price of power alcohol; but it is more than possible that the amount of reduction, when measured in pence per gallon, would prove to be disappointing.

In the article on this subject in *The Motor Cycle* a few months back, the author quoted the drop in price of German potato spirit, from 3s. 9d. in 1887 to 9d. in 1904. As a matter of fact, it was the system of bounties, arranged by the German Government to favour the agrarian interest, rather than any commercial reason, which caused this great reduction in price, and the net effect of this political arrangement was that potato spirit was sold here at a cost less than that of production.

The Misleading "Proof" Gallon.

A word of warning is necessary when dealing with statistical figures for alcohol. The quotations invariably refer to proof gallons, unless stated to be otherwise, and the price of 9d. referred to is equivalent to about 1s. 2½d. per bulk gallon, so, for the sake of clarity, all the figures quoted in this article have been reduced to the common sort of gallon.

According to the evidence given before the Departmental Committee on Industrial Alcohol (1905), it was shown that for the year 1904, quoted in the previous article referred to, the fixed price at which the German potato distillers sold their spirit to the Cartel was 2s. 7d. per gallon, including tax averaging about 9d. This spirit was afterwards sold here at about 1s. 2½d. per gallon, and the difference, plus working expenses and profit, altogether about 1s. 5½d. per gallon, was recovered by means of remission of tax, and bounty.

A similar law was in force in Austria, where it was provided that the selling price of spirit for export was not to be more than 20 marks per hecto. (about 11d. per gallon), *less than cost price*.

At the same inquiry, it was given in evidence that in Germany, with potatoes at 1s. per cwt., and with all revenue restrictions, and restrictions on purchases, removed, it might be possible to reduce the production cost of alcohol to 25 marks per hectolitre (about 1s. 1½d. per gallon).

Low Potato Prices Essential.

As 1 cwt. of potatoes produces rather less than two gallons of alcohol, it would seem that the cost of the potatoes was about 6d. per gallon, and the labour, fuel, and other charges, about 7½d. per gallon. From this we can deduce that the present cost of production of potato spirit would be, roughly, 6d. per gallon for each shilling per cwt. of the potatoes, plus the present equivalent of 7½d. for fuel, labour, etc., in 1904; so that, taking into consideration the fact that the calorific value of alcohol is to petrol as 9 is to 14, and assuming working costs have not more than doubled since 1904, it will be seen that potatoes must be obtainable at 2s. per cwt., before we can think of potato alcohol competing with petrol, even if all revenue restrictions were withdrawn.

It is a great mistake to consider that there is nothing in the way of cheap alcohol for motorists but the Excise regulations. It is a fact that the Government is in sympathy with any reasonable movement, but some restrictions are obviously necessary to safeguard the spirit revenue, but the potato growers have a very long row to hoe before the Government can be blamed for the fact that potato alcohol is dearer than petrol.

It seems much more probable that the alcohol for the motive power of the future will be distilled from sugar products, waste grain, or possibly wood, or produced synthetically from lime and coke, unless the by-products of ordinary grain distillation should increase in value sufficiently to make that type of spirit a serious competitor with petrol.

SEEANEE.

FOR WINTER WEAR.

FOR some time past we have been using an excellent form of protection against the elements in our daily rides. This consists of a coat supplied by I. Taylor and Son, of New Park Street Mills, Leeds. It is constructed of leather cloth, which is only distinguishable from real leather on close examination. Storm cuffs, a deep collar, and a belt form part of the garment, and in spite of the fact that it has been severely tested on several occasions not a drop of water has penetrated the fabric. It is not altogether an easy matter for a mere male to describe any article of wearing apparel, but the D.R. Trench style motor coat, as this particular article is described, has given perfect satisfaction as far as protection is concerned, and that, after all, is more important to the motor cyclist than the cut. This is not meant to convey the idea that the cut is defective—far from it—but as we do not feel qualified to act as judges on this question, we leave the decision to our readers, who may judge from the illustration.

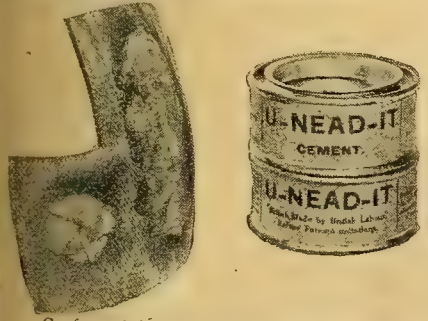
A useful coat of leather cloth.

SIMPLIFIED PUNCTURE REPAIRS.

A VERY simple and time-saving system of repairing punctures and cuts has recently been placed on the market by Messrs. E. James and Co., 34, Regent Street, W.1. The process, which is known as the "U-nead-it," simply consists of scraping and bevelling off the cut, or puncture, with a knife, or scissors, smearing over the surface of the repair with a specially provided solution, and filling the hole with the "U-nead-it" filling compound.

The filling material is a plastic compound which, on being pressed into the puncture with the fingers, dries very quickly, and practically makes a weld with the surrounding rubber of the inner tube. In the case of an ordinary puncture, the tube can be placed in the tyre and pumped up almost immediately after the repair, and the pressure of air in the tyre and heat generated while on the road only results in further homogeneity of the filling compound. To deal with a cut in the outer cover, the same process of repair is gone through.

The "U-nead-it" outfit is sold in motor cycle size at 3s., but a small cycle size is sold at 1s. 3d., and a car size at 5s. 6d.



Surface of inner tube shown after repair by the "U-nead-it" process

Section of inner tube, showing the "U-nead-it" filling compound pressed into the bevelled hole of the puncture.

Messrs. E. James and Co. are also shortly bringing out the new "Tal-Pear" inner tube, the distinctive feature of which is the five-ply rubber used in the tube construction, to render it impossible for a cut in the tube to spread.

A SPRING FRAME CONVERSION SET.

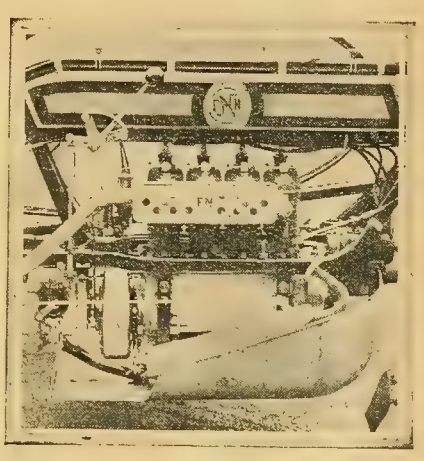
FRAME springing which can be incorporated in existing machines is a feature in which many of our readers will be interested, and especially so when the adaptation can be made by the rider himself.

Such a device has been patented by Mr. A. E. Robbins, of London Road, Bilton, near Rugby, and we have tested it on a 2¼ h.p. two-stroke Triumph and find that it answers the claims which are made for it.

Briefly, the arrangements consist of a rigid frame composed of two triangles, which replace the existing back forks of the machine. Pivots are situated at the lower end of a vertical member directly under the saddle, or, in the case of machines fitted with gear boxes, the pivots are fitted at the rearward end of the gear box bracket. Swinging about each of these pivots is an arm which carries the rear axle lugs, and a swinging link is pivoted at the extremity. This link acts as a shackle for a pair of laminated springs. One of these springs is of the semi-elliptical pattern, and is secured to the rigid part of the frame a little distance above the pivot previously mentioned. The other is a C spring, and this is anchored to the rear extremity of the triangular back frame.

The action of these springs is particularly smooth, and the compensating effect damps out all violent oscillations. The carrier and mudguard are attached to the rigid portion of the frame, and, in consequence, there is practically no unsprung weight other than that of the wheel itself. So far as we can judge, the tension of the belt is not appreciably affected even at the extreme positions of the arms which carry the wheel. Lateral motion of the rear wheel is prevented not only by the width of the shackle bearings, but by the heavy construction of the pivot bearings themselves.

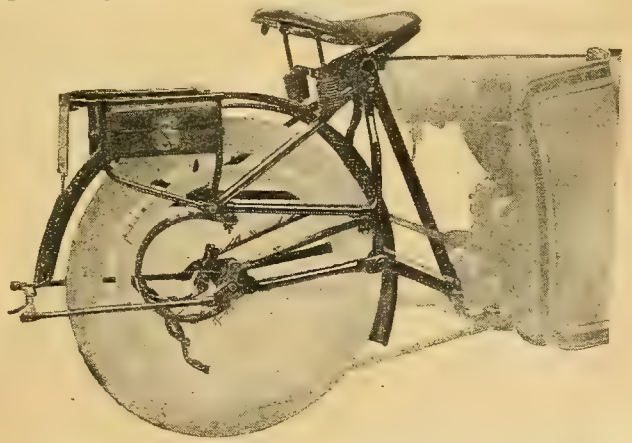
Under actual riding conditions it was found that the Triumph machine could be driven over extremely bad roads at any reasonable speed with perfect comfort, while the resilience of the rear springing about equals that of the front forks.



An undershield of aluminium fitted to an F.N. four-cylinder engine.

MUDGUARDING AN F.N.

THE owner of one of the latest pattern 7 h.p. four-cylinder F.N.'s, which is illustrated, evidently has done his best to combat the mud fiend, and not without success. Beneath the engine he has fitted a large aluminium tray, with a valance at the sides and front, and so protects the magneto. Mr. Gelder, the managing director of F.N. (England), Ltd., however, fears that this shield will prevent the crank case from being adequately air-cooled, and that the oil, in consequence, will become too heated.

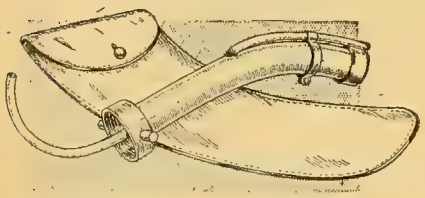


A Triumph two-stroke lightweight fitted with the Robbins spring-frame conversion.

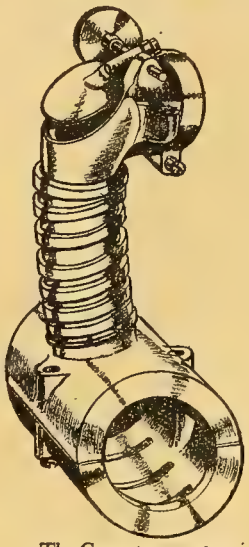
R3

AMONG THE ACCESSORIES.

A Selection of the Latest Ingenious Fitments for the Well-equipped Machine.

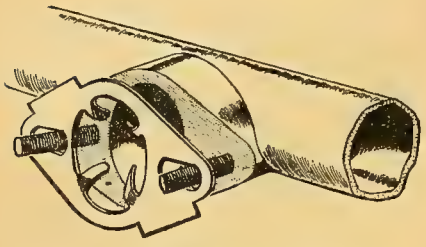


Patent filler by Pettetts, West Pier, Brighton. It is sold for 8s. 6d., or, with case, 18s. 6d. It is claimed that it will empty, without waste, a two-gallon can of petrol in twenty seconds.

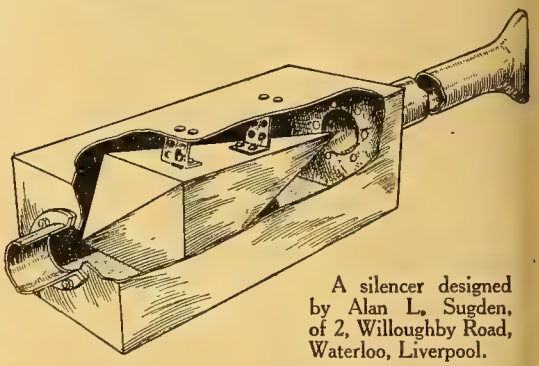


The Capac temperature regulator, which consists of an aluminium muff intended to be clipped to the exhaust pipe. A shutter is provided, adjustable by means of a knurled screw.

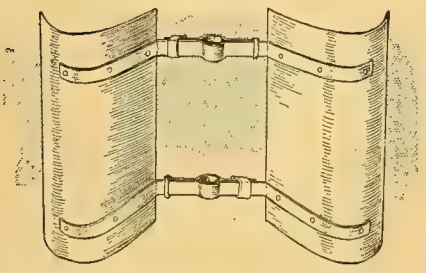
E. W. L. valve silencer, arranged to clip on long exhaust pipes, made by E. W. L. Accessories, 102, Lancaster Road, East Ham, London, E7. The piston valve, by uncovering the ports in the barrel, enlarges the exit when the pressure is highest.



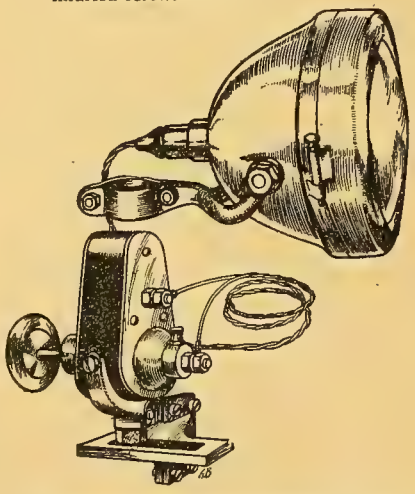
The "Save-U-Petrol" economising device, consisting of curved vanes, which set up a whirling motion in the mixture as it passes through the induction pipe. It is marketed by Messrs. Allen and Simmonds, Ltd., Thames Side Engineering Works, Reading.



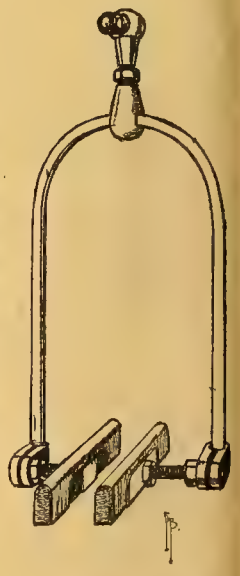
A silencer designed by Alan L. Sugden, of 2, Willoughby Road, Waterloo, Liverpool.



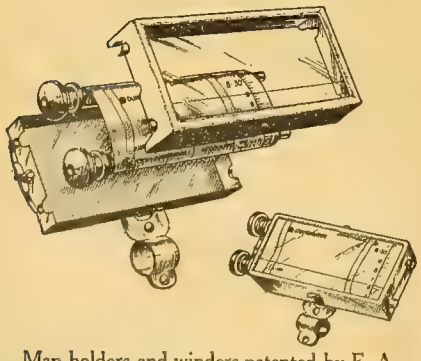
A simple mudshield designed by J. McLaren and W. D. Hatcher, of Dalriada, Chesswood Road, Worthing.



A Voltalite friction-driven dynamo set for motor cycles which sells complete for £7 4s. The generator alone costs £4 12s., or, with conversion accessories for existing acetylene lamp, £5 2s. It is made by Ward and Goldstone, Ltd., Salford, Manchester.

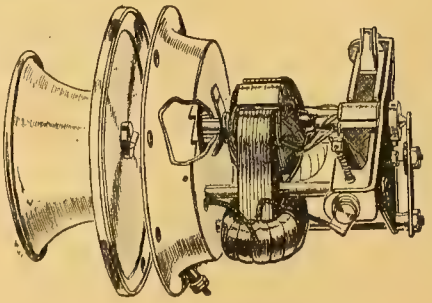


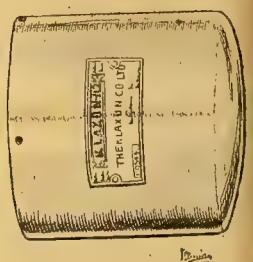
The latest pattern Bowden front brake. The fibre shoes are held in clips, the sides of which are recessed in the fibre, so that it is impossible for the shoes to leave position when once they have been securely fixed.



Map holders and winders patented by E. A. Considère and A. Elston, of Coventry.

A Klaxon electric horn for motor cycles, introduced by the Klaxon Co., Ltd., 36, Blandford Street, London, W.1.





NOTES FOR THE NOVICE.—V.

VARIABLE GEARS—2.

(Continued from page 351.)

IN the only four-speed gear box at present in general use on motor cycles, viz., the A.B.C., and in some three-speed gear boxes, only one pair of pinions are always in mesh, and these are generally the two which connect the driven sprocket or pulley to the lay shaft, and are termed the constant mesh pinions. In these boxes no other pinions are engaged when in top gear, but one other pair is brought into action as each of the lower gears is requisitioned in its turn.

Hub gears, engine shaft gears, and some few others have been made on the epicylic principle, but these are not found on present-day motor cycles.

Selective Clutch Gears.

The selective clutch type of gear, such as the P. and M., Enfield, and Scott, is usually found on two-speed machines, but a three-speed variety was incorporated with the 1920 Motosacoche. These gears are practically fool-proof and allow great facilities for altering the set ratios. Each gear is practically direct, and is brought into action by means of a friction clutch. It is usual to have two chains from the engine to the countershaft and one to the rear wheel, and the disadvantage of these gears consists in the fact that the two engine chains have but one adjustment, but this is not at all serious in practice, as the chains being short a certain amount of looseness is permissible. A gear of this kind is sometimes combined with a two-speed gear box to give four speeds.

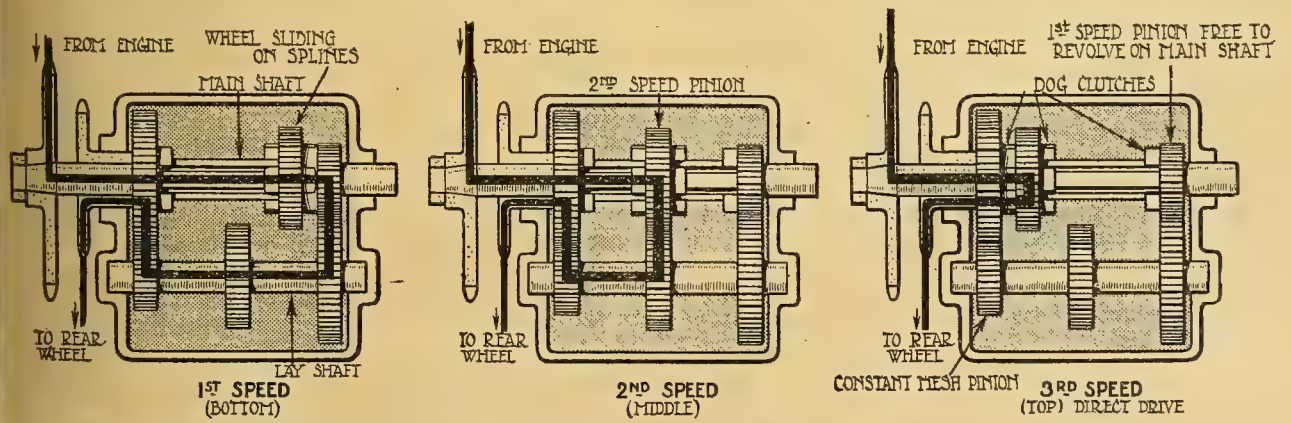
The T.A.C. four-cylinder motor cycle (afterwards the T.M.C. and later the Ogston) was provided with a gear box very well suited to such a machine. The engine drove the mainshaft and the drive was taken to the rear wheel from the lay shaft, the final transmission being by shaft and worm. Thus every gear passed through one pair of pinions and no more, but one pair would have been necessary on top gear with the conventional box having a direct drive on top speed to transfer the shaft from the centre of the machine, where the engine was situated, to the side the position of the shaft extending to the rear wheel.

The variable gears which the use of a belt permits, such as the Rudge Multi, Zenith Gradua, Philipson and Grado pulleys, and the like, will be discussed in a later article.

In my last notes on variable gears I referred briefly to the various types commonly found on motor cycles. I now propose to describe their action and to add some remarks upon how they should be cared for.

Sliding Pinion Mechanisms.

Referring first to the sliding type in most general use, the sketches on this page, which are purely diagrammatic and have the controlling mechanism omitted for the sake of clearness, show how the gear changes are made in a simple type of three-speed gear box. The main shaft is above and the lay shaft below. Reading from left to right, the first pinion on the main shaft is in one piece with, or keyed to, the sleeve which carries the driven sprocket, but it can revolve upon the main shaft; the second pinion is free to slide but not to revolve on the main shaft; and the third is free to revolve but not to slide. The centre pinion is provided with dogs on each side which can engage with similar dogs on the first and third pinions and lock either of them to the shaft. When the third (or top) speed is in action, no power is passed through the lay shaft, although it is revolving idly with two of its pinions in mesh, and the drive is said to be direct. It



Diagrams showing how the power passes through a three-speed gear box when the various gears are in action. The heavy lines show the path of the drive from one point to another.

Notes for the Novice.—

will be readily understood that, even when the direct drive is being used, the gear box, on account of its internal friction, must consume a certain amount of power; but this waste of power can be reduced to a minimum by the use of ball or roller bearings, and the careful design of the pinion teeth. Therefore it must not be expected that a variably geared machine will climb so well "on top" as a single-speed machine with the same gear ratio.

In the example shown the power is taken from the gear box on the same side as it enters, and both chains will be on the left of the bicycle. Where the power is taken from the right side a slight modification is necessary, but the principle remains the same. Taking the sketches in order, the first (on the left) shows the second speed pinion as far as it will go to the right hand of the gear box, and the dog clutches holding the low speed pinion to the main shaft. This gives the first (or low) speed, and the power passes through the whole length of the lay shaft and to the driven sprocket *via* the constant mesh pinions (as shown by the heavy line on the sketch). In the second sketch the second speed pinion has moved to the left and is engaging the corresponding pinion on the lay shaft, the low gear pinion, and now free to revolve on the main and consequently becomes inoperative; both dog clutches are out of action, and the second speed is engaged, the drive passing through the centre pinions along half the lay shaft and out through the constant mesh pinions as before. In the third sketch the second speed pinion has moved out of engagement and as far as possible to the left. The sleeve carrying the driven wheel is now locked to the main shaft and the third, or top, speed is engaged. This is the direct drive, so called because the power does not pass through any of the pinions, and the two sprockets revolve together as if rigidly attached to one shaft, as indeed they are for the moment.

Having mastered the method by which the power is taken through the gear box illustrated, which resembles the gear boxes used on the A.J.S., Humber, New Hudson, Rover, Indian, and other machines, the novice should have no difficulty in following the working of other gears which work on similar principles.

(The next instalment will also deal with Variable Gears.)

COMPLAINTS AND THEIR CAUSES.

How the Customer may facilitate the Supply of Spares.

WE daily receive letters of appreciation from motor cyclists who have been well treated by the makers of the machines they ride. We also receive communications of the reverse kind, and we have frequently investigated the complaints contained in them. It is only fair to British manufacturers to say that in many cases apparent lack of attention has been due to unreasonable impatience of the owner. Occasionally, no name and address are enclosed; at other times an agent will not be so prompt in ordering as his customer thinks—or he may miss a post.

The question of payment, too, may hold up supply, for it is obvious that even the largest firm cannot open a ledger account for every small item ordered from them.

Complaints Not Always Justified.

Often we have been shown the whole of the correspondence relating to cases of alleged unbusinesslike treatment, and, even when this has been sent to us by the complainant, the indignation expressed has seldom been justified. A case in point has reached us wherein a well-known firm received a letter from an agent on the 8th, dated the 6th, asking if a certain part could be supplied. The firm wired immediately promising immediate delivery and quoted a price. On the 10th another letter was received dated the 9th, ordering the parts, which were despatched at once. Concurrently a wire was received requesting immediate delivery. Three days later—the 13th—the makers received a letter dated the 10th, from the owner of the machine in which he stated that he considered the treatment he had received most discourteous and unbusinesslike. Obviously the owner was the victim of delays on the part of his agents and the postal service.

In cases of urgency, we would recommend readers to (1) Send a prepaid wire asking if the required part can be supplied at once and also the price; (2) to wait a reasonable time for a reply, bearing in mind that most offices close at 5.30 or 6 p.m.; (3) accurately to name the part; (4) to be sure that the name and address or telegraphic address both of addressee and addressed are correct; (5) on receipt of reply to wire the remittance. This probably saves a couple of days over the postal service, but when the latter is used one's requirements may be made more clearly.

Whether the replacement is required at home or when on tour, it is generally more satisfactory to deal through the agent for the particular manufacturer, when there is one at hand. An enterprising agent may have the part in stock. But it is not quite reasonable to expect an agent to rob a stock machine—although we have met agents who have done this. Dealing through an agent reduces to a minimum any delay likely to arise through the accountancy department "at the other end."

BROADER EXPERIENCE WANTED.

WE have yet to see incorporated in one machine all the good points which have impressed us in various models. There are some that have most of them, but it is only by experience on the road with machines of different makes that a designer can hope to obtain any idea of the ideal of the experienced motor cyclist. It has often astonished us to meet designers who appear to be unaware that their productions are not quite up to the average on some particular point, and of their ignorance concerning the merits of their contemporaries. The same applies to sidecars. Some makers seldom ride long journeys in their vehicles, and fewer still make opportunities to experience the comfort, or otherwise, of their leading competitors' designs.

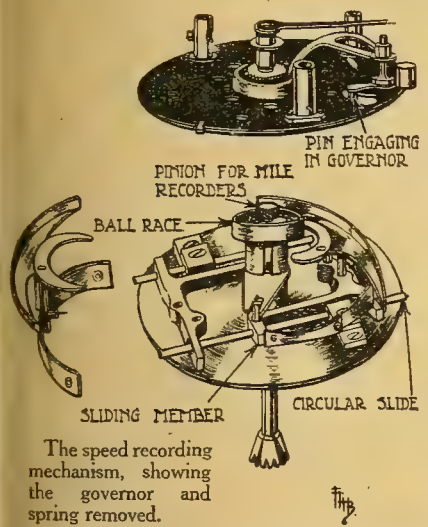
TESTING A SPEEDOMETER.

A Well-made Instrument governed by Centrifugal Action.

THE manufacture of delicate instruments such as speedometers not only necessitates highly trained and skilful workmanship, but also requires the most careful and untiring tests in order to remove the remotest possibility of failure when in use.

A most instructive tour around the works of the Cowey Engineering Co., Ltd., Archer Works, Kew Gardens, Surrey, was recently enjoyed by a representative of *The Motor Cycle*, when the apparatus used for testing the Cowey speedometer demonstrated the almost cruel treatment to which they are subjected in order to ascertain their qualities of resistance to road vibration.

The principle of operation used in this instrument adheres to the usual centrifugal action. The shape of the governors and the method of housing them, however, are somewhat unusual. Significant of all Cowey productions, simplicity is the



The speed recording mechanism, showing the governor and spring removed.

governing feature, and, as may be seen in the illustration, the speed recording mechanism consists merely of two elliptical governors mounted on slides, which, in consequence of centrifugal action, ride away from each other on two circular rails as the speed is increased. Deceleration allows a spring, which is held to the centre of each governor by a pin, to draw the weights towards the centre. Located above the governor, and below the brass bed, are ball races, which, being held in the body of the speedometer, allow the central spindle, bed, and governor to rotate *en bloc* within the case of the instrument.

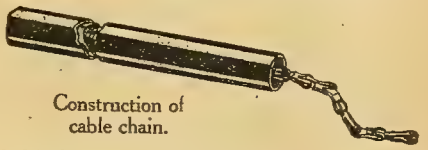
Direct Readings.

The speed indicator hand is moved round the dial in a very simple manner. Protruding through a slot cut in the plate fixed about the governors (shown black in the illustration) is a small pin which fits between the outer rim of the governors and the edge of a small half-moon-shaped plate fixed to the latter. It will be seen, therefore, that, as the governors expand and contract, the pin is moved along the slot and at the same time rotates the spindle, to which it is attached by a small arm. Mounted on the spindle is a quadrant engaging with the pinion on the indicating spindle. This moves the pointer round the graduated dial.

Other interesting features in construction are to be seen in the cable and chain used to transmit the drive from the road wheel, and the trip mileage indicator.

Testing Methods.

During the inspection of the mechanism used for testing these instruments, we found the plant by which large numbers of speedometers are checked for accuracy to be intensely interesting. An accurate timepiece, the dial of which is graduated at half-second intervals, forms an important part of the machine, and mounted immediately below is a device much resembling the rear end of a camera. Driven from an electric motor a master speedometer, of larger dimensions than the manufactured instrument, indicates the speed of the motor as the handle of the rheostat is moved. Also driven from the same shaft are a number of bevel pinions, which conduct the drive to the speedometers held in racks for testing purposes. Thus, it is possible to check each new instrument from the indicating hand on the larger speedometer. Before absolute accuracy can be obtained, however, it is necessary to ascertain that the electric motor is running at a constant speed, which is checked as follows: Mounted behind the camera screen is a rotating plate, on the surface of which an eccentric slot is cut, and on each stroke of the pendulum, controlling the half-second clock, an electric flash runs vertically across the centre and



Construction of cable chain.

behind the rotating dial. It will be understood, therefore, that if the time taken for the dial to complete one revolution varies, the spark will be observed, through the eccentric slot, at points of varying distances from the centre of the disc, when the fault may be corrected.

In addition to the foregoing tests, the speedometer is placed in a machine vibrating far in excess of that experienced on the road, and by means of a mirror the indicator can be observed and steadiness checked.

The Cowey productions are handled in London by the Bancroftian Co., 64, Bishopsgate, London, E.C.2.

A WELL-TESTED SPRING FORK.

THOUGH the Maplestone spring fork has not previously been seen on the British market, it would be incorrect to describe it as a new fork, since it has been thoroughly tested on Australian roads for six years past. The features of the Maplestone fork are simplicity and strength, added to which the appearance is neat and the strength of the single compression spring is adjustable. Our illustration, which shows the Maplestone fork fitted to an old countershaft Triumph, is self explanatory. The spring takes off from a dog leg link just above the mudguard, and at the top bears against a screwed member carried in a stout lug. This screw forms the adjustment for the spring compression.

Simple and Efficient.

Somewhat wider bearings will be fitted to production models, and provision for a front brake is easily arranged, since the fork moves with the wheel. A short trial on the road convinced us of the excellent shock absorbing qualities of the fork, and, not content with a road test, the machine was driven over a rough section of a common for a distance of about half a mile. Throughout the run the fork behaved admirably, and, despite the fact that the spring had not been adjusted to suit the weight of the rider, only one very severe bump caused the fork to bottom on the guard.

Our conclusions were to the effect that so simple and admirable a fork is bound to enjoy considerable popularity in the near future. Messrs. Maplestone Cantilever Spring Forks, Ltd., of Birmingham, have acquired the sole manufacturers' rights for Great Britain. For the present correspondence should be addressed to the new firm at Precision Gauges, Ltd., Wrentham Street, Birmingham.

The Maplestone spring fork, designed in Australia, and tested for six years on the roads of that country.

TWO L.M.C. TWINS FOR 1921.

Advance Particulars of Well-known Machines designed for Overseas Requirements. L.M.C. Saddle Suspension to be sold also as an Accessory.

GOOD material and plain straightforward design have always been characteristics of the L.M.C. motor cycles. To these reasons perhaps is due their popularity Overseas, where they may be found in every clime.

In the Home Country, too, they are far from unknown, which goes to show that conditions generally are not so widely different as is sometimes supposed.

For the past year the Lloyd Motor Engineering Co., Ltd., has, like many of its contemporaries, been labouring under difficulties of obtaining raw materials, with the result that the new models now about to be introduced have long since passed through the experimental stage, and have had a thoroughly good testing while awaiting production facilities.

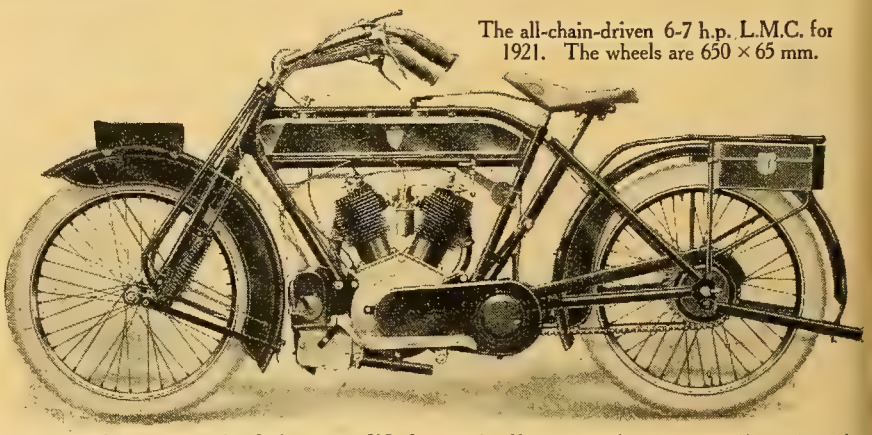
The chief features of the 1919 6-7 h.p. model are retained, the main alteration being the all-chain drive in place of chain-cum-belt transmission, although, if desired, the latter will be supplied to those who appreciate its comparative simplicity. In lieu of a fully-enclosed case for the rear chain, a light guard is fitted on this model.

A "Between-size" Engine.

Of 842 c.c. capacity, the engine, which has a bore and stroke of 76 mm. and 86 mm. respectively, is a size midway between the 750 c.c. engine so popular before the war, and the 1,000 c.c. power unit in vogue at the present time. It will, therefore, appeal to those big twin enthusiasts who are thinking of a little reduction in capacity to counteract the increased price of petrol.

The other model is larger all round, with 28×3in. wheels, a three-gallon tank, a higher frame, and a larger engine. The last-mentioned has a capacity of 960 c.c., the cylinders being 79×98 mm.

As will be seen from the illustration, the design is extremely compact, there being no gaps between the various units. Notwithstanding, it is possible to remove the cylinders without disturbing the rest of the engine. The well-known L.M.C. spring forks are retained in a modified form. They have now long phosphor bronze bearings to the links at the fork-ends, and, as there are adequate means to lubricate these bearings, the forks should stand up to the hardest sidecar work.



The all-chain-driven 6-7 h.p. L.M.C. for 1921. The wheels are 650 × 65 mm.

An amply wide mudguard is fitted to the front wheel. It is so made that the fork members pass through it, thus securing a clearance of more than an inch on each side of the tyre. At the rear wheel, too, a wide guard is fitted.

Braking is concentrated upon the driving wheel, and takes the form of an internal expanding ring of bronze actuated by a pedal and a hand-operated external band brake. As an alternative to the latter, however, a block brake to work inside the V of a special rim is supplied to order.

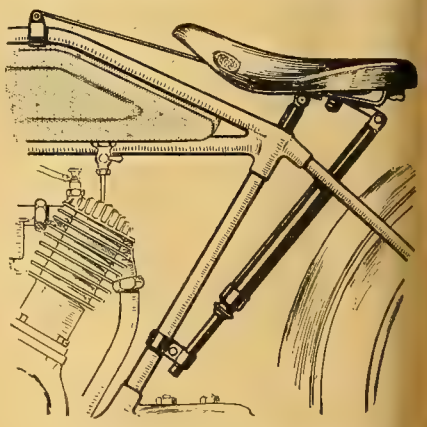
Comfortable Seat Suspension.

On both models Lloyd's patent suspension is used to give saddle comfort. It will be remembered, perhaps, that this device consists of a saddle top fixed to a cantilever beam pivoted well forward of the rider and extends to a position approximating to that of the usual springs. Here the beam is connected to a long spring-loaded plunger which also carries stays supporting the rear ends of the footboards. Under the centre of the saddle is a roller supported on another plunger, with springs and distance pieces according to the weight of the rider.

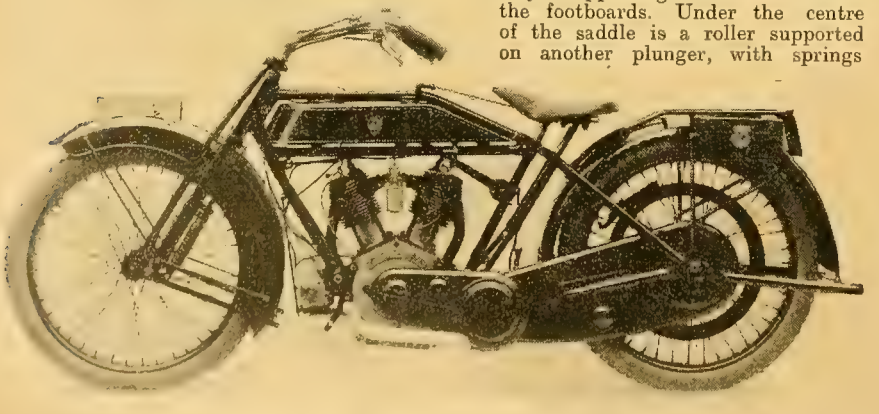
At the time of writing we have in our possession one of these new models fitted with this device, and we have no hesitation in saying that it is one of the best substitutes for a spring frame we have tried. The streets—especially the side streets—of Birmingham are notoriously bad, and for the first time since the war we have traversed them in comparative comfort on the L.M.C.

We have found the machine to be exceptionally fast, while the spring forks function in a manner that leaves little to be desired in this direction.

It is the intention of the Lloyd Motor Engineering Co. to market the saddle suspension part of this device separately for existing machines. It may be fitted to almost every machine on the market which has a tube over the tank. We feel sure that agents who are enterprising enough to demonstrate this device will find employment for their mechanics, during the slack time in the winter, by fitting it to their customers' machines. No structural alterations are necessary, and it may be possible to utilise existing saddle tops.



L.M.C. saddle comfort will be available for riders of other machines; the makers are placing the device on the market as an accessory.



Enclosed chain drive, a 960 c.c. engine, and 28in. × 3in. wheels, are features of the 1921 L.M.C. 8-9 h.p. Colonial model.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

SPEED AND RELIABILITY.

Sir,—*Apropos* my letter re speed and reliability, I cannot refrain from calling attention to the fact that Mr. V. Horsman, who captained the winning team in the Reliance Cup Eliminating Trial, used the identical machine, frame, wheels, *engine*, etc., that he used in his famous record hour ride at Brooklands, altering the gears only.

What better evidence could we have that reliability need not be sacrificed to obtain speed? JAS. L. NORTON.

A MODERN JUGGERNAUT.

Sir,—May I call your readers' attention to the great risk entailed by the driving of motor fire-engines at excessive speed. These heavy vehicles are suddenly loosed upon the country, sometimes when the roads are full of motor and pedal cyclists. That fire-engines are absolutely necessary, and that sometimes lives depend upon their speedy arrival cannot be doubted. But I think I am right in saying that in the country this is the exception rather than the rule. My point is this. Should they be allowed to run the risk of taking human lives so that their arrival at the scene of a stack fire may be timely? Shall the motor fire-engine be likened to Kipling's :

". . . . . bucko ship
Which always killed one man per trip."

A B.S.A. rider turning from a broad main road into one equally broad, had to cross in front of one of these vehicles to gain the left side of the road. The driver of the fire-engine was unable to avoid a collision, and carried both machine and rider upon the front of his bonnet an incredible distance before it finally crushed him against a tree, by the road side, which was almost felled by the impact. The driver did his utmost to avoid a collision, but the fault lies to the account of the law which gives these vehicles the freedom of the road. Who turns a corner expecting to meet a huge vehicle doing thirty miles an hour? If I had been a few seconds earlier I should, doubtless, have shared the fate of the unfortunate motor cyclist. Anything might have come out of that side road : a child, a deaf man, or a girl on a two-stroke.

Is it necessary for us motor cyclists to put our machines on the stand and advance to reconnoitre? DOUGLAS.

CANDID CRITICISM.

Sir,—I note you have made several comments on my letter to you, which you publish under "Candid Criticism." I trust you will give me the opportunity to reply to them, as I fancy you somewhat missed the point of my remarks. You also defend the trade on the score of wages, etc., being enormously increased. I admit that prices are up all round, but is that any reason why a maker should get orders under false pretences? Strong words, but true. I do not want anyone to give me something for nothing; but what I order and pay a deposit on I expect to get, and so do most people.

I know quite a lot of people who cannot carry on, and intend to sell their machines. They could not afford a motor bicycle before the war, but, owing to abnormal times, etc., have found themselves with a few pounds to spare, and bought a machine, forgetting that times must come back to the normal. I think the influx of this type has given the trade a false impression of the actual market. There is not the huge increase of actual riders as is supposed.

If it were possible to make a motor bicycle to retail at £25 and cost about a halfpenny a mile to run (which I know it is not) the majority of the riders would be *new* to the sport; but, if the figures be £60 and one penny per mile respectively, then they are not affected. That was the impression I tried to convey in my last letter. The number of actual motorists are, more or less, what they were in 1914.

If one examines the average carrier and notes how many lugs and joints there are on it one can understand why prices are up. That article is a flat contradiction to the manufacturers who state they try to keep prices down.

But, in all my experience (I have had eighteen machines), there is one *Motor Cycle* I shall not grumble at the price of, and that comes out weekly and costs 4½d. C.V.T.

Horsehay, Salop.

Sir,—*Re* the letter in your issue of September 23rd, signed "C.V.T.," I should like to make the following points clear:

(a) The coil ignition system was given up for the following reasons :

(1.) Unreliability and leakage of the accumulators.

(2.) Failures in the coil.

(3.) The rider could never venture far from his base on the accumulators.

Let "C.V.T." ride one of the coil ignition machines, of which a few are still in existence, for fifty miles, and he will probably realise the reason why the system was discarded.

(b) The a.i.v. was discarded for the same reasons as coil ignition—unreliability and failure to function, usually due to "sticking" valve.

(c) The price of the petrol tank is quite in accordance with the cost of construction :

	£	s.	d.
Construction of tank (materials not included in cost) with skilled labour at 2s. 6d. per hour (one hour)		2	6
Enamelling (including labour) about 10s. ...		10	0
One lubricating pump	1	0	0
Two filler caps and one petrol tap		5	0
Total	£1	17	6

At that estimate, the tank is made with only a small margin of profit.

To fit up a fuel and lubricant tank from petrol tins would cost but little less without the effect of the well-enamelled real article. HARLEY.

Harrow.

A LONG TOUR ON MOTOR-ASSISTED CYCLES.

Sir,—A short time ago I saw in your columns an account of the Simplex motor unit, and, as it seemed a good thing, I purchased two units, one each for my wife and self. These I had attached to our cycles (Singers), and after riding about fifty miles to get used to them, we decided to go by road on our holiday to Minehead.

From Great Missenden to Marlborough, *via* Newbury, the roads were very good, but from that point to our destination, through Trowbridge, Frome, Wells, and Bridgwater we gave the units a thorough testing. As many of your readers are doubtless aware, the roads in many of the above districts are not "great," and several of the hills encountered made one think it foolish to attempt to ride them with such a small engine, but the handy little unit stood the test, and, with slight pedal assistance, we were able to ride every hill.

On the return journey we took a more southerly route, through Taunton, Wincanton, Amesbury, Hungerford, etc., and again we found many stiff hills, but, as before, with slight pedal assistance, we were able to climb them.

Both units went through this severe test (about 350 miles) most satisfactorily, and I have nothing but praise for them.

I think the work of my unit the more remarkable, because I carried about 50 lb. of luggage and half a gallon of petrol, and I weigh 12 st. At every place at which we stopped many enquiries were made about the attachment.

A slight defect in the lady's unit caused us some trouble; but it is only fair to the makers to say that they have since remedied it and replaced the part affected. Beyond this, both of them more than came up to expectation, and I should think that when they are better known to the cycling world they will achieve a ready sale.

I may add that some of my friends imagined that the engines would shake the cycles to pieces, but, so far, their fears have been imaginary ones, and the old cycles are as good as ever, despite the rough and hilly roads over which they were driven. GEO. W. COWAN.

A TOUR IN THE HIGHLANDS.

Sir,—It was with great pleasure that I read "Wharfedale's" description of his "Tour in the Highlands," and I notice that he went through Hamilton, and by doing so must have gone through Glasgow, which is very disagreeable, as there are miles of tramway lines.

I take the liberty to suggest an alternative route, which, although a few miles longer, cuts out all Glasgow.

Coming along the Carlisle road, there is a turning a few miles before Hamilton. This is on the left and is marked by the A.A. Taking this turning, go straight through Stonehouse to Strathaven, and the route is as follows: Strathaven, East Kilbride, Busby, Paisley, Erskine Ferry, and turn left after crossing the ferry to Bowling. About two miles out of Bowling there is a fork; turn right and (this is the Stirling road) it is straight all the way to Bonhill, from where it is only a few miles to Balloch.

The surface is moderately good, but bad in patches between Strathaven and East Kilbride. If this route is taken the only part of the road where tramlines are encountered is at Paisley, where there is about half a mile, and from Erskine Ferry to the fork at the Stirling road. This road cuts out Dumbarton. JAMES McLAREN.

Sir,—I have read with interest your article on "A Tour in the Highlands," and can confirm what "Wharfedale" says about the scenery and some of the roads, having just completed a tour from London to John-o'-Groat's and back.

Last July I obtained delivery of a 2¼ h.p. single speed Levis, and, after a few short trial runs, set out from London on August 21st on the great adventure, with all my luggage on the carrier. If I mention the places at which I slept on successive nights your readers will be able to follow me on the map; but I went out of my way several times to call on friends. My resting places were, consecutively, Leek, Penrith, Stirling, Blair Atholl (*via* Callander and Killin), Inverness, and Helmsdale.

I started from the Commercial Hotel on a fine morning, August 29th, climbed the Ord of Caithness, ran down the dangerous Berriedale, took the nasty turn to the right at the bottom, and up the other side without a stop, then on to Wick, and John-o'-Groat's. Here I had lunch and signed the hotel register, returning *via* Thurso and Latheron to Helmsdale. My halts on the way South were Inverness, Fort William (two), Oban, Callander, Edinburgh (two), Durham, Blackburn, Arnside, Lichfield, and so home to London on September 10th.

I had only four rest days, two of them being Sundays, one very wet day, and a day to climb Ben Nevis from Fort William. I also visited Glencoe from Ballachulish and the Trossachs from Callander.

The machine was sufficient for all the hills I encountered, and my only trouble was a defective belt, which broke three times, and had to be replaced by a new one at Killin, where, luckily, the only repair shop in the village had a new ¾in. Dunlop in stock. Two single-point plugs of different makes were used alternately, and both of them are still in commission. The fact that the machine ran 250 miles on the last two days of the tour, and that the engine, carburetter, and magneto gave no trouble whatever during the whole 2,000 miles, is sufficient proof of its reliability. I had only one puncture, and no breakages except the belt.

To show that it is never too late to taste the joys of motor cycling, I will state that I am a novice with only one year's experience, and my age is nearer sixty than fifty. I may add that I have no trade interest in the Levis.

London. XC 1721.

LOWER PRICES NOT IN SIGHT.

Sir,—May we as manufacturers be allowed to express our appreciation of the leading article in your issue of September 23rd with regard to reduction in prices?

In our opinion the present depression is mainly attributable to two factors. First, the attitude of both the London and Provincial Press towards the motor trade, and, secondly, the foolish statements made by a section of the traders whereby the public have been misled into expectations of a reduction in prices.

With regard to the first, it is merely a waste of time on the part of the manufacturer to try and combat these wild rumours, which no doubt benefit the newspaper circulation, and it is only articles such as yours which can be used to inform the public of the real state of affairs. Articles written by people who really know, and who are in touch with the trade, should be more valuable and convincing to a private individual than those written by an alarmist.

The second point is, however, one we consider should be brought to the notice of the trader, who thoughtlessly harms himself in general with the whole trade.

The post-war cost of material and labour has increased quite out of proportion to the increase in price of the retail article. Consequently it is necessary for the manufacturer to increase his production to be able to pay a fair interest on his necessarily increased capital. The only way to do this is to keep his order book full, and any action which prevents this is a further set-back.

We would all like to see prices fall, but this cannot occur until outputs have been increased, and anyone who in any way dissuades possible purchasers is not only postponing this, but is doing even more harm in that he is placing the manufacturer in the position that he will either have to increase his prices or go out of business altogether.

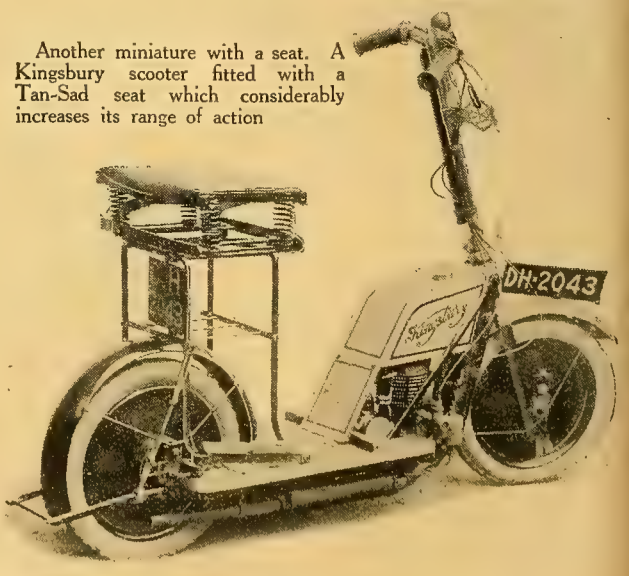
THE COWEY ENGINEERING CO., LTD.
T. M. McARTHUR, Director.

ELECTRIC LIGHTING ON MOTOR CYCLES.

Sir,—I had acetylene lamps with separate generators fitted to my 5-6 h.p. Rudge combination delivered in September, 1919, and found they were fairly satisfactory on long runs, but were distinctly inconvenient when overtaken by darkness a few miles from home, so much time being wasted in getting them to "go"

Last January I purchased a 6 volt 80 amp. accumulator and fitted it into the compartment at the back of the sidecar, and, utilising all the existing lamps, made a very convenient installation. By unscrewing the burner blocks of the acetylene lamps it was an easy matter to use the lamps for electric globes, and, although I have done a lot of night riding about Town since January, I have had to touch no part of the installation, and its convenience cannot be overestimated. In the event, improbable I think, of trouble with the electric lighting, I could adapt the lamps to take acetylene again in fifteen minutes on the road.

W. J. LACEY, JUN.



Another miniature with a seat. A Kingsbury scooter fitted with a Tan-Sad seat which considerably increases its range of action

Sir,—Having read with interest the article and correspondence on the subject of electric lighting in past issues of *The Motor Cycle*, I would like to tell you of my experiences with an Edison accumulator.

Purchased two and a half years ago, this has given complete satisfaction. Eight cells are required to give 12 volts when in use, while for a 20 amp.-hour set the weight is nearly the same as that of a 4 volt 20 amp. lead battery. It stands up to vibration and road shocks remarkably well. I had a metal case made for it, and fitted on one side of the carrier under the toolbag, and have travelled over 11,000 miles on all sorts of roads in England, Wales, and the South and West of Ireland without the least damage to the accumulator, although one might think that it is in the worst position possible. It is, of course, tightly packed in its case with pieces of old inner tube, and so far the only attention it has required has been the occasional addition of small quantities of distilled water and one complete renewal of electrolyte (cost 2s.).

The Edison accumulator holds its charge very well, and is not injured by high charging rates; I charge at 5 amps.

For local use I have a 2 amp. ½ watt type lamp fitted, giving 48 c.p., but use a 12 c.p. lamp for touring, although charging can be completed in a single night. An electric Klaxon is also in constant use.

A useful tip to prevent glare from the head light is to use ground glass and cover the ground surface with a thin film of castor oil. This gives a very good light with the minimum of glare.

In conclusion, I would add that I also have "sworn a mighty oath," but have kept to it, and have not the least intention of reverting to an acetylene outfit, with its mess and leaky tubes! I am looking forward to the time when a really satisfactory dynamo (such as the Lucas Magdyno), suitable for a solo machine, will be obtainable without such remarks as "cannot supply for another year at least."

Liverpool. W.S.C.

A CAMPING TOUR.

Sir,—The photograph shows the camp of myself and another lady beside Loch Lomond, who, during the latter half of August, took a 1,200-mile tour on a Matchless outfit.

On the shores of Loch Lomond. How two ladies fared on a twelve hundred mile camping tour is described in the letter of "M.M.R."

Our route was from Somerset, *via* the Wye Valley, Liverpool, Carlisle, and Glencoe, to Ballachulish, on Loch Linnhe, thence by the coast road to Oban, and backwards and forwards through the Southern Highlands of Scotland, sometimes lodging in a two-roomed cottage, sometimes camping on the loch shores or open country, and so on through the Trossachs and to Edinburgh, whence we headed due South for home over the Yorkshire Moors.

Many, I had almost said most, of the roads we traversed were quite unspeakable as to surface, and some of them, notably the road from Tyndrum to Rannoch Moor, were simply a mass of unrolled flints about the size of the top of a cottage loaf.

The only trouble of any sort was the breaking of the driving chain connecting link, which somewhat tore the chain case, and the wearing of one wheel spindle, due, I suppose, to my having neglected to tighten the cone.

We accomplished the 1,200 miles in sixteen days, spending three and a half days in camp.

Besides personal luggage, about 11 lb. each, we carried our tent (10 lb.), a spare tin of petrol, and two gallons of lubricating oil. M.M.R.

Bridgwater.

SHOULD TWO-STROKES BE HANDICAPPED?

Sir,—Mr. Jas. L. Norton has not put the case of the two-stroke quite clearly, and to do so I offer the following comparisons with an ordinary four stroke.

THE POWER STROKE.—Exhaust opens approximately in the same position in both types.

INDUCTION (four-stroke).—Inlet opens with piston at the commencement of stroke and remains open for a very short period on the compression stroke. This short period is called "lag," and is designed solely to crowd more gas into the cylinder at high speeds.

INDUCTION (two-stroke).—(1.) The piston must close the transfer port; this equals 12% of the induction stroke wasted. (2.) The opening of the inlet port is delayed until the piston is near the end of its stroke, and the whole of the charge must pass in in a very short time. In order to extend this time as much as possible the port is made longer than the equivalent lag on the four-stroke. (3.) The result is loss of charge at low speeds, and strangulation at high speeds.

COMPRESSION (four-stroke).—The whole of the stroke is available, excepting the lag of the inlet valve, which is purposely designed as aforementioned.

COMPRESSION (two-stroke).—This commences when the piston has moved past the exhaust port. This is equal to 25% of the total stroke wasted.

To condense the above the two-stroke has the following handicap:

(1) 25% loss of effective compression stroke.
(2) 12% loss of induction stroke.
(3) No possibility of adjusting timing of opening and closing ports to take advantage of the well-known principles of fluids in motion.
(4) On account of the short period of opening, the ports are not able to pass a full charge at high speeds, which results in the power curve soon falling off. Both engines suffer from this trouble, but the two-stroke certainly gets the worst of it, therefore the two-stroke of this type will never equal the volumetric efficiency of an engine like the Norton Big 4. P. J. GOODMAN.

VELOCE, LTD.

SUMMARY OF CORRESPONDENCE.

"BY 6864" and Mr. C. A. Gur write on the advantages respectively of the Portsmouth-Ryde and Southampton-Cowes routes to the Isle of Wight. The excellent treatment afforded him by Messrs. W. J. Green, Ltd., Coventry, makers of the Omega-Jap, forms the subject of a letter from Mr. C. S. Fraulin, Grimsby.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Excessive Belt Wear.

I have a 3½ h.p. Bradbury with light sidecar and N.S.U. two-speed gear, which devours belts more quickly than my pocket can supply them. My present belt has not done 1,000 miles, and has shed most of its rubber. It does not get oily, and I keep it at the proper tension. Can you suggest a possible cure, or do you think a leather belt would prove more economical?—N.H.

In all probability the excessive belt wear is due to the pulleys being worn or out of line, and there is very little you can do to correct this. It would perhaps be better to use a leather or leather and canvas belt. These can be obtained from the larger accessory stores, although their popularity has waned considerably. The disadvantage of leather belts is that they require frequent cleaning and dressing, otherwise they quickly wear out the pulleys.

An Old Engine.

I have just bought an old single-cylinder machine which certainly needed overhauling. This I have done, and am desirous of obtaining the correct timing, etc. As it is I have re-assembled the engine, making the exhaust valve to close an inch on the flywheel before top dead centre. The inlet valve is automatic, and the carburetter is a White and Poppe. On starting the engine up it ticks over all right with the throttle a little open, but if I gradually open the throttle to full it slows down and stops. Further, while running, there is a back pressure in the carburetter as if the valve is leaking, but I cannot see that it can be that, as I have thoroughly ground in both valves. Could it be that the automatic inlet valve spring is either too weak or strong? I trust you will give me the best valve setting, magneto setting, and what size jet I should use.—A.H.B.

The exhaust valve is closing too early. It should not close until the piston has reached top dead centre. No doubt this early closing of the exhaust valve is the cause of the back pressure, which occurs when the throttle is open. A stronger inlet valve spring would also improve matters. The magneto should be timed so that the spark occurs when the piston is on top dead centre with the ignition control two-thirds retarded. Without knowing the bore of the engine and the type of carburetter in use, we cannot help you, but most W. and P. carburetters had automatically variable jets.

Two-speed Gear Adjustment.

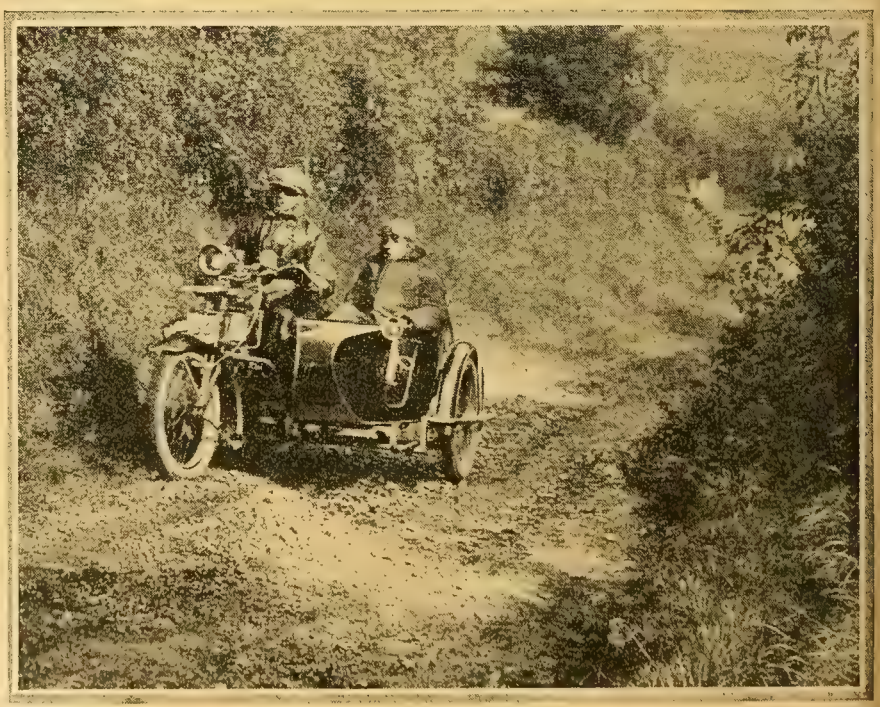
I am in possession of a 6 h.p. 1920 Royal Enfield, and have done about 1,300 miles. I am troubled with a jarring noise in the gear case, and also the starting sprocket slips round at times when starting up. I have taken the cover off the gear case, and find that the metal plate on the outside of the gear wheels is rubbing on the gear case. The gear chains are also slack.—T.B.

Presumably the gear chains require adjustment, and this you would be able to do if you follow the instructions given in the handbook published by the makers of the machine. It is quite likely that the noise arising from the gears is caused by the chains being sufficiently loose to strike against the chain case when the engine is running. The starting sprocket should not slip if the ratchet teeth are undamaged, and if the spring behind the ratchet sprocket has not lost its tension. These parts require lubricating with thin oil at frequent intervals.

The N.S.U. Gear.

I have a 3½ h.p. Triumph fitted with an N.S.U. gear. (1.) Is this gear easily taken down? It does not appear to function properly at present. Is there a free engine position? (2.) I do not intend to use this machine this year. Must I register it?—J.W.W.

(1.) The N.S.U. two-speed gear is quite a simple device, and is quite easily dismantled if you remember that the only left-hand thread in its construction is the large lock ring, which secures the inner part of the pulley to the main body of the gear. If the gear is in order, you should certainly obtain a free engine position, although this is sometimes not very apparent until the engine is running, owing to friction. The free engine is found between the high and low gear positions, and when the operating handle is tightened fully for the low gear, a half turn in the opposite direction should give a free engine. (2.) If the machine is not used, a licence is unnecessary.



AUTUMN SUNSHINE FAVOURED THE WEST MIDLAND TRIAL.

E. Williams (6 A.J.S. sc.), with the advantage of previous experience, hugs the right-hand bank on Flagstaff Hill. (A detailed account of the trial appeared last week.)

Bad Starting.

I have had considerable experience with two-stroke machines, but I have now purchased a 2¾ h.p. New Imperial-Jap. It seems to be in fine condition, but I require your advice on account of the great difficulty I have in starting it from cold. Particulars of what actually happens are as follows: Belt slips round the pulley on the driving-shaft when the exhaust lever is dropped; it is very stiff when raised, but when dropped it completely locks the pulley and the wheel simply skids. It appears to me that the oil on the piston rings causes the piston to stick to the cylinder walls, but probably I am wrong. When the wheel is revolved by hand, at a certain position it becomes impossible to continue the revolution. At this point, if the compression tap is turned on a hiss of air can be heard, and then all becomes easy. To start the machine from cold, I require all the family's assistance.—F.A.

If your belt slips over the pulley when you release the valve lifter, clearly the belt is too slack, or the pulley groove of wrong angle. Take half-an-inch out of the belt. The stiffness you refer to is usually present in motor cycle engines during the winter months. It is simply due to congealed oil on the piston or the piston rings. If you squirt a few drops of petrol or paraffin into the cylinder, this will greatly facilitate starting. You, of course, make a point of flooding the carburetter before attempting to start, and also closing off the air-supply. You will find that during the winter months a lighter grade of lubricating oil would minimise any engine stiffness.

An Old Machine.

My 1911-12 2¾ h.p. Douglas has been standing idle for four years, but I am dragging it out again, as it has done well in the past. My trouble is this, however. It will start on the stand, but not on the road. I have had it to pieces, because I sheared the key and scored the flywheel badly. The following defects occur: After pedalling hard on the stand the engine will start, but when running fast (still on the stand) little puffs of vapour issue from the gauze on the carburetter. When the throttle lever is "off" it still runs. I timed the engine thus: The exhaust valve begins to lift when piston is within ⅜in. of the bottom of the firing stroke, or, in other words, the crankshaft at about four o'clock. The firing I timed as follows: Piston top dead centre, magneto fully retarded. I am afraid I have not the correct valve timing, and some other trouble. The carburetter is an Amac 26 jet; the sparking at plugs is good.—F.W.P.

Time the valves so that the exhaust closes about 5° after the piston has reached the top of the stroke, and the inlet opens 3° or 4° before the same piston position; this degree of overlap is usual on the Douglas engine. You have the ignition timing just a little bit too far advanced, and it would be better to set the contact breaker so that the points just separate when the piston is at the top of the stroke with the control two-thirds retarded instead of fully retarded. The blow-back through the carburetter may be caused by the inlet valves closing too late, while the fact that the engine will not stop on the throttle is probably due to the slides in the carburetter being badly worn.

Chain Stretch.

Will you give me some means of judging the state of the chains on my 7-9 h.p. Indian? To go on till one breaks a chain is rather unsatisfactory, as it usually occurs at an inconvenient, not to say dangerous, time. Nevertheless, one is loth to scrap a chain with several hundred miles life left in it. Could you give me a figure for percentage stretch after which a chain is done? My present chains are Duckworths, ⅝×⅜. I think a table giving particulars for the most usual sizes of chain and largest makers would be of great value. —H.A.H.

Chain breakages do not usually occur as a result of wear, and they may occur at any time in the life of the chain. A breakage is just as probable with a new chain as with an old one, as such troubles are usually the outcome of running the chain in bad alignment or excessively tight. Care should be taken that the chain wheels are correctly in line, and also that the chain is of the correct tension, having about ½in. up and down play midway between the sprockets. If the chain is stretched so badly as to be seriously out of pitch, the trouble will be obvious, as it will be noticed that the chain commences to mount the teeth of the sprocket, and it should be discarded when this stage is reached, or breaking or jumping off may ensue. A table of chain sizes appears in the latest edition of "Motor Cycles and How to Manage Them," which can be obtained from our publishers. As far as the British trade is concerned, the bulk of the motor cycle chain business is in the hands of two or three firms. The Duckworth chain fitted to your machine is of American manufacture.

READERS' REPLIES.

Defective Drip Feed.

Being a B.S.A. owner, and having read your reply to "B.W.," also "R.M.B.'s" and "Scottie's" replies, I thought it advisable to chip in, too. For a week I was troubled as "B.W." was, and, after tinkering with ball valve, pen steel disc, etc., I finally discovered that the trouble was due to a leak between the glass tube and the top leather washer. I should advise "B.W." to withdraw the glass tube and examine leather washers, and see that a perfect joint is being made on both faces. To test the tightness of the tube after refitting, open regulating valve a few turns, and force the oil into the glass tube by pulling the pump piston upwards. Immediately this piston is at top, press down quickly, and repeat the pull. Should there be a leak, this will show immediately the glass is full, as it is then under pressure. On the other hand, should the oil run into the crank case quickly enough to make it impossible to fill the tube, then the system is tight and will work perfectly.—J. A. LAMB.

Adjustment of Automatic Carburetter.

With reference to "R.J.P." re his question in your "Questions and Replies" page, I should like to let him know that I experienced the same trouble with my Blackburne engine. After trying three carburetters, seven jets, and two magnetos I got no better results, but after many weeks (including six weeks the engine was at the works) I discovered the exhaust valve spring was very weak, and fitted a new special long spring from Blackburnes. The uneven firing ceased from that day and has never occurred since. I have been able to help several other riders suffering from the same fault with equally satisfactory results in each case.—D.A.G.

RECOMMENDED ROUTES.

EDINBURGH TO SHEFFIELD.—J.D.G.

Edinburgh, Dalkeith, Newbattle, Gorebridge, Stow, Galashiels, Melrose, Jedburgh, Carter Bar, Byrness, Woodburn, Corbridge, Riding Mill, Castleside, Bishop Auckland, Piercebridge, Scotch Corner, Catterick Bridge, Leeming Bar, Boroughbridge, Wetherby, Collingham, Bardsey, Leeds, Hurslet, Lofthouse, Wakefield, Barnsley, Sheffield.

LONDON TO CHURSTON (DEVON).—G.

Kentish Town, Regent's Park, St. John's Wood Road, Edgware Road, Park Lane, Knightsbridge, Kensington High Street, Hammersmith, Brentford, Hounslow, Staines, Egham, Bagshot, Hartley Row, Basingstoke, Overton, Andover, Salisbury, Wilton, Hindon, Mere, Wincanton, Ilchester, Ilminster, Chard, Honiton, Exeter, Chudleigh, Newton Abbot, Totnes, Kingsbridge, Churston.

SAFETY FIRST.

One could write reams on what not to do when riding a motor cycle, but Mr. F. H. Headley, of the Tan Sad works, seems to have covered most points in fourteen terse hints, which are printed inside the Tan Sad Insurance Policy, which has been formulated specially for the benefit of owners of pillion seats. Incidentally, this policy has been arranged on the basis that pillion seats do not increase risks, a view not shared by the majority of insurance companies who sometimes charge an extra premium when a pillion passenger is carried.

The hints referred to are as follows:

1. Railways have few accidents because they constantly examine all nuts and screws, so that everything is secure. Follow the example and do the same.
2. Do not race.
3. Do not always try to get ahead of everybody else on the road—let the other fellow overtake you if he wants to.
4. Always keep to the left of the road—always avoid being on the wrong side.
5. Pull to the left quickly when a vehicle wants to overtake you.
6. Never try to pass on a corner.
7. Always make sure the road is clear before overtaking any vehicle.
8. Sound the horn too much rather than not enough.
9. Drive most cautiously across cross-roads and when turning into other roads.
10. Avoid tramlines—better lose a minute than a limb
11. Be most abstemious in taking intoxicating liquors—better not at all when in charge of a motor cycle.
12. Avoid riding pillion unless you have a properly sprung seat, and especially see that the feet get support.
13. If you are riding pillion, make sure your carrier is strong enough.
14. Be courteous; do not be selfish; always consider the other man—better be safe than sorry.

Roads in China.

A 180 mile motor road is being constructed in China, and will extend from Peking to Tientsin.

Watson-Bourne joins the Trade.

J. A. Watson-Bourne, who won second place in this year's Junior T.T. on a 2¾ h.p. Blackburne, will in future be associated with the new Powell motor cycle, designed by Mr. Alec Burney. Before very long we may see Watson-Bourne's familiar figure astride one of the new Wrexham productions in competitions.

A Douglas Trial.

A trophy (value 40 guineas) presented by Messrs. Douglas Motors, Ltd., the usual medals and several useful accessory prizes form an attractive prize list for a trial to be held on October 17th, for privately-owned Douglas machines only. The course, which will embrace the characteristic charming scenery of the Yorkshire Dales, will start and finish at Harrogate. Entries and enquiries should be addressed to Captain Ellison Hawks, the Douglas Depot, Harrogate.

Fire at Martinsyde's.

The fire which occurred recently at the Martinsyde works was confined chiefly to the aircraft section, where the damage was considerable. The manufacture of the Martinsyde-Newman motor bicycle, however, has not been interfered with in any way.

IMPORTANT DATES.

Oct. 9th—
M.C. and A.C. Open Reliability Trial.

Nov. 4th-13th—
International Automobile Exhibition, Olympia and White City

Nov. 29th.-Dec. 4th—
Olympia Motor Cycle Show.

Dec 26th-27th—
M.C.C. London-Exeter Run.

Parisian Motor Cyclist Policemen.

In the middle of October M. Raux, Prefect of Police in Paris, will receive delivery of a consignment of 2½ h.p. solo and 6 h.p. sidecar outfits manufactured by Blériot. The organisation will start with twenty-four machines. The exact duties which the motor cyclist policemen will carry out has not yet been published, but we understand that the number of motor cyclist policemen employed will be increased in the near future.

Special Features.

FUEL ECONOMY.

A DESPATCH RIDER'S JOURNEY HOME.

HINTS FOR THE NOVICE.

Brooklands Next Saturday.

The championship meeting of the B.M.C.R.C. will take place on Saturday, beginning at 1 p.m. All the eight events, embracing the usual solo and sidecar classes, and one for three-wheeled cycle cars not exceeding 1,100 c.c., will be five-lap championship scratch races.

A Successful Year.

The first annual statement of the Scott Motor Cycle Co., Ltd. (which took over the business of the late Scott Engineering Co., Ltd., in 1919), shows that the trading of the year ending July 31st has had very favourable results, the net profit for that period being £26,523. It has been decided to increase the capital of the company, in order to deal with its greatly increased business, and it is proposed to issue 100,000 new £1 shares.

We recently inspected the new works extensions, and greatly admired the way in which the manufacture of most of the essential parts has been concentrated in the one factory. The productive capacity of the plant has been doubled during the past twelve months, while the well-known competition record of the Scott machines has fostered an increasing demand.

An untouched snapshot of Gus Kuhn (Levis) taking a watersplash in the Levis single-gear trial on Sept. 26th. Kuhn evidently believed in getting the agony over quickly, for he took the splash at speed, as will be observed.

Indians for 1921.

The American papers announce no radical changes in Indian motor cycles for 1921.

Fuel in Australia.

In 1919, Australia imported 20,748,969 gallons of motor spirit, ten times the amount imported in 1910.

Look to your Bearings.

At this time of the year it behoves motor cyclists to overhaul their wheel bearings, and to see that there is plenty of grease at all points likely to suffer through the intrusion of rain.

A Weather-proofing Tip.

Quite a good tip for winter riding emanates from the veteran competition rider, Mr. F. W. Applebee, who makes a compound by heating and mixing resin and oil, for covering up magneto terminals. The substance is not so brittle as shellac.

Slow Running Indeed.

"How many times per revolution does the inlet valve open?" is a question which the aspiring R.A.F. or M.T. recruit was often asked, and simple as it is, many tripped over it. The simple facts of the four-stroke engine are not yet universally safe ground, however, for we were amused to read in a recent semi-technical review that a certain 90° twin engine would idle at 120 r.p.m., since an inlet valve was timed to open thirty times in 15s.!

In Season.

We would remind readers that it is much easier to clean a machine while mud is wet than to wait until it has set hard. In addition, it does less damage to enamel. We always try to give our machines a "hose over" immediately at the end of a journey, after first wrapping the magneto in an oily rag.

Arrowing of Trials.

Youthful precocity has accounted for many competitors in recent trials running right off the course. Usually the arrows are turned right round, and a Wolverhampton correspondent suggests that such alteration could at once be detected if the arrow were underlined by a thick black bar. Of course, this would incur the issue of two sets of arrows for right and left turns respectively, but we think something of this nature must eventually be adopted if the inevitable small boy is not to upset even the most completely organised events.

Congratulations.

Congratulations to Mr. E. J. Bass, of the Essex M.C. and the A.C.U., on the occasion of his marriage last week.

N.B.

We receive many queries, which, by omitting the stamped addressed envelope, do not comply with our rules in this matter. Writers of postcards requiring routes are the chief offenders.

A Low-priced Outfit.

The Dunelt big two-stroke which did so well in the Six Days Trials is now emerging from its final tests, and arrangements are well in hand for a modest output of sidecar outfits at a popular price.

73.6 m.p.h. for 206 Miles on the Road.

A Harley-Davidson has won the second annual road championship in America. The course was a circuit 302 yards over five miles, and had to be covered forty times. The average lap time of the winner was 4m. 8.92s., the average speed being 73.63 m.p.h.

Width of Roads.

To prevent misconception, the Roads Improvement Association is publishing some useful data regarding the width of roads, etc. For instance, a "road" means the total width of a thoroughfare between the property boundaries on both sides, while the "carriageway" is that portion of the road carrying the vehicular traffic. Thus the proposed "120 feet" road would have an actual carriageway of 60ft., which, in the opinion of the R.I.A., is an ideal width.

Many modern ideas in frame construction have been embodied in the Unibus machine shown here undergoing tests. A full description of this miniature was given in *The Motor Cycle* for August 19th.

Power!

We hear of a new two-stroke which is developing 5 h.p. per 100 c.c.!

Two-stroke Sidecar Outfit for 1921.

The Beardmore-Precision will be introduced as a sidecar outfit next year. The sidecar chassis will be of a unique design with a sprung wheel.

Preparations.

Makers are now busy preparing their new models for the Show. Some are hesitating whether to hold them up for the time being, because of past experience in getting into production with new machines.

A Mistaken Thoroughbred.

Sandwiched between bees and ferrets, a Blériot Whippet is offered for sale in the *livestock columns* of the *Western Gazette*.

Makers' Instruction Booklets.

Some machines are equipped with a thoroughly sensible assortment of tools and a comprehensive book of words; others, alas, leave the parent factory unaccompanied by a word of advice to the prospective rider—they must tell their own tale and suffer according to the lack of "horse sense" of the buyer. We met quite the limit, however, on a recent machine, which was graced with instructions printed for issue with an earlier model with radically different adjustments.

Second-hand Prices.

Although it is admittedly difficult to strike a fair average even with identical models of the same machine—"condition" and presence or absence of accessories are variable factors not always apparent in an advertisement—these figures, representing the highest and lowest prices quoted for the various models, should help prospective buyers in their choice of a mount.

A.J.S., 6 h.p., sidecar, 1918-19	£165–£220

Zenith, 8 h.p., sidecar, 1920	£155–£210

The M.C. and A.C. Open Reliability Trial.

Several novel features are to be included in the Midland Cycling and Athletic Club and South Birmingham Motor Cycling Club reliability trial on October 9th. (We give the club's somewhat unwieldy title in full as the initials suffer greatly from misinterpretation.) And the severity of the event may best be judged by the fact that whereas ten marks are deducted for failure on Alt-y-Bady or Bwlch-y-Groes, only five may be lost on each of three anonymous hills bearing the ominous names, "Gough's Conscience," "Whitworth's Grave," and "Urry's Pet." Innovations are an information bureau at the start, and a bottom-gear speed test.

The B.M.C.R.C. Second Open Meeting.

Brooklands Motor Cycle Meeting in conjunction with Essex M.C. Car Races.

SHOWERY weather caused considerable delay in the running off of the Second B.M.C.R.C. open race meeting on Saturday last, the event being organised in conjunction with the Essex Motor Club, who were responsible for the car races which were run alternately with those for motor cycles.

The Junior Open Motor Cycle Handicap (about 8½ miles) attracted 27 entries, and there were few non-starters. It was open to solo motor cycles with engines not exceeding 500 c.c. The machines were started at the fork, which they passed twice and then entered the straight. Rain had poured down on the track during the morning, but save for a few puddles the surface was practically dry. Amongst the machines competing in this event Harry Martin's Matchless was equipped with a Claudel-Hobson carburetter for each cylinder. Its rider was pushed off by W. H. Wells, but when the engine fired it did so with such energy that Wells fell, cutting one of his hands and his knee on the rough surface of the track. As the limit man had over 4½m. start of the scratch men he had completed his first lap before the last five started.

Result. (Winner's speed 63 m.p.h.):

		Start.
1.	R. C. Chawner (3½ Sunbeam)	1m. 12s.
2.	W. A. Jacobs (2¾ Singer)	2m. 27s.
3.	G. S. Smith (3½ B.S.A.)	1m. 12s.
	L. E. Pope (3½ Matchless)	9s.
	W. H. Sinnett (3 A.B.C.)	48s.
	R. E. Dicker (3½ Norton)	9s.
	P. G. Kennedy (3½ Norton)	15s.
	H. R. Harveyson (7 Indian)	9s.
	S. E. Longman (2⅞ Wooler)	2m. 18s.
	J. P. Riddeck (3½ Zenith)	1m. 12s.
	H. Martin (3½ Matchless)	9s.
	J. D. Walker (3½ Triumph)	1m. 12s.
	T. Thompson (2¾ Douglas)	54s.
	F. A. McNab (2¾ Wooler)	2m. 54s.
	V. Longden (3½ Douglas)	1m. 21s.
	E. Longden (2¾ Dot-Jap)	1m. 21s.
	E. R. Cullison (2¾ Douglas)	2m.

The Senior Open Motor Cycle Handicap was about 8½ miles in length, starting and finishing as in the first race, and for motor cycles with engines exceeding 500 c.c.

Danger of Brakeless Machines.

Baldwin and Harveyson both crossed the finishing line at an estimated speed of 90 m.p.h. Harveyson, who had no brakes, could not pull up, and shot clean over the banking; machine and rider were tossed high in the air, the former being found 100 yards from Harveyson, who, however, was lucky enough to escape with a dislocated shoulder and torn ligaments of the leg. The incident provoked much discussion on the advisability of allowing a machine to compete which was unprovided with brakes, and the use of the long finishing line. Result (winner's speed, 75¾ m.p.h.):

1.	O. M. Baldwin (8 Matchless)	15s.
2.	H. R. Harveyson (7 Indian)	Scratch
3.	K. Don (8 Zenith)	Scratch
	D. H. Davidson (4 Harley-D.)	1m. 18s.
	R. Charlesworth (6 Zenith)	1m. 9s.
	L. A. Cushman (8 Zenith)	57s.
	A. A. Houlberg (8 Harley-D.)	30s.

A heavy shower followed, involving a delay of an hour and a quarter, until the track was sufficiently dry.

The next motor cycle event was the Open Three-wheeler Handicap for three-wheeled cars and motor cycles with sidecars of any class, passenger to be carried. The distance was the same as in the previous races. The event was very well supported, as there were 26 entries, and the results were as follows (winner's speed, 61½ m.p.h.):

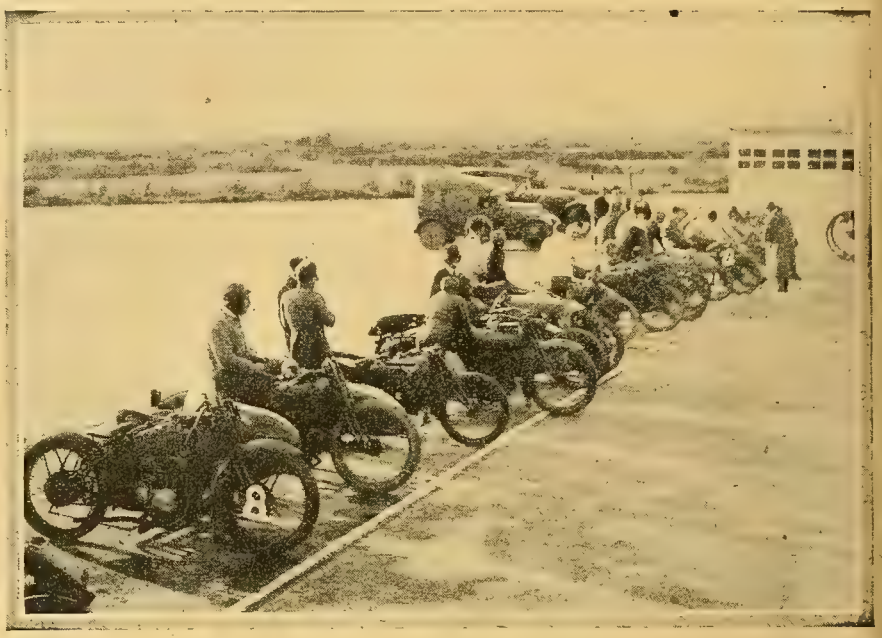
		Start.
1.	T. A. Masters (8 Harley-Davidson)	1m. 31s.
2.	V. Olsson (7 Indian)	2m. 30s.
3.	E. A. Bridgman (7 Indian)	2m. 30s.
	R. Charlesworth (6 Zenith)	2m. 36s.
	F. A. Longman (4 Ariel)	4m. 33s.
	H. G. Cookson (4 Norton)	1m. 51s.
	D. H. Davidson (4 Harley-Davidson)	2m. 21s.
	A. J. Rowe (4 Triumph)	3m. 12s.
	S. E. Longman (8 Harley-Davidson)	1m. 45s.
	R. C. Chawner (3½ Sunbeam)	3m. 12s.
	G. S. Smith (3½ B.S.A.)	3m. 12s.
	E. C. Baragwanath (8 Zenith)	1m. 3s.
	L. A. Cushman (8 Zenith)	1m. 39s.
	J. A. O'Sullivan (8 Harley)	1m. 31s.
	E. Longden (8 Morgan)	1m. 45s.

The last two motor cycle events were accorded a flying start. Mr. S. G. Cummings, the president of the Essex Motor Club, drove a powerful Brasier car, which carried Mr. Ebblewhite, the timekeeper. This the competitors followed, and when a speed of about 50 m.p.h. had been attained the signal to start was given, and the men shot forward.

A Scratch Race.

The Junior Scratch Race was open to motor bicycles with engines not exceeding 500 c.c. The machines passed the fork once and then entered the straight. Viewed from the car the start was most interesting. Result (winner's speed 66.38 m.p.h.):

		Start.
1.	P. G. Kennedy (3½ Norton)	—
2.	L. Pope (3½ Matchless)	—
3.	R. E. Dicker (3½ Norton)	—
	G. Smith (3½ B.S.A.)	—
	T. Thompson (3¾ Douglas)	—



On Saturday the Essex M.C. held their car meeting in conjunction with the B.M.C.R.C. at Brooklands. The scene is the start of the open three-wheeler handicap.

In the Second Essex Light Car Handicap (about eight and a half miles), A. G. Fraser-Nash's G.N. finished a good second.

The final event of the day was the Senior Open Motor Cycle Scratch Race (two laps) for motor bicycles with engines exceeding 500 c.c. (rolling start). Le Vack (Indian) started well in front of the official car, and was, consequently, disqualified. Baldwin (Matchless) led at the start, but retired owing to a broken petrol pipe. The winner was E. Remington (8 Nut-Jap). Speed 79.15 m.p.h., while A. F. Houlberg (8 Harley-Davidson) came in second.

RETROGRESSION OR PROGRESS?

ONCE motor cyclists planned routes to avoid certain hills, especially if they drove the earlier passenger machines. Nowadays, we never doubt the hill-climbing abilities of the modern machine, and it provides a shock to fine oneself stalled on a main road journey by a hill which cannot be climbed. Such an experience may be the lot of those who sample miniature sidecar outfits. Engines of 2¾ h.p. will not climb even all the main road hills in the Midlands when their load is increased by the weight of sidecar and passenger. The modern medium and heavyweight go-anywhere passenger machines were evolved as a result of attempting to achieve the apparently impossible. The miniature sidecar outfit may become entirely dependable by a like process. But, after forgetting the niceties of "running alongside," isn't it hot work helping the process of evolution!

Cycle Cars in General Efficiency Tests.

Runabout Types compete with Orthodox Light Cars in Junior Car Club Annual Trial.

CYCLE CARS IN THE JUNIOR CAR CLUB GENERAL EFFICIENCY TRIAL. (1) A Tamplin driven by Kensington Moir at Coombe Bottom. (2) W. F. Davenport (A.V. two-seater) in the brake test on Brooklands test hill. (3) A Thurlow three-wheeler is seen climbing Ranmore Hill. (4) A. G. F. Nash's G.N. on the same hill.

ON Wednesday of last week the Junior Car Club carried out a general efficiency test in which several cycle cars were entered, including the Richardson, A.V., Tamplin, G.N., and Thurlow. The tests included a road trial, engine starting, acceleration, speed, hill-climbing, slow running on top gear, springs, and petrol consumption. The cycle car types, on the whole, did not show up to advantage in the road trial compared with the more expensive cars, which, however, were by no means excellent.

In the engine-starting test, the Tamplin was quite good, but Severn (A.V.) could not get under way, and retired. G. C. Vredenburg started his G.N. easily by using his starting handle as a kick-starter, but he stopped his engine when he tried to open the throttle. A. G. F. Nash (G.N.) had some difficulty in getting his engine over compression; and C. Finch, on a similar machine, after starting his engine smartly, could not get away for some seconds.

The Tamplin was fast in the speed test, but T. G. Ellis's G.N.-Vitesse was better. On the test hill Davenport's A.V. and the two Richardsons failed. The G.N.'s went up very well.

CG

A Stiff Hundred Miles in Yorkshire.

The Autumn Reliability Trial of the Scarborough M. and M.C.C.

ON Wednesday, September 29th, this newly revived club held its first post-war reliability trial over an old pre-war course of 112 miles.

Starting at Scarborough, the route led through Pickering, Helmsley, Chop Gate, Ingleby Greenhow, Castleton, Lealholm, Limber Hill, to Egton Bridge for tea, and afterwards *via* Egton Bank, Grosmont Hill, Sleights, Blue Bank, Saltersgate, and Pickering, to Scarborough, a sporting course, with several very stiff gradients, some watersplashes, and bad corners.

Four ladies entered, but only two—Miss F. S. Wilson (2¼ Velocette) and Miss Ripon (4 Triumph)—started at their scheduled time, and both put up a very fine performance.

The first thirty-one miles led over main roads, but, after leaving Helmsley, the route got more severe, and a bad corner and a steep drop down to a watersplash nearly caught several competitors napping.

After the tea interval each competitor was sent away in the order of his arrival up Egton Bank, down the Haggs, and then up the redoubtable Grosmont Hill. This hill starts straight up from a railway level crossing through the village with a gradient of about 1 in 6, then turning sharp to the right the gradient stiffens to about 1 in 4 with a very bad surface of loose stones over a "flower bed" variety of under surface.

Only fourteen clean ascents were recorded on this hill, although four were observed using their feet to keep their balance. The remainder were either thrown or stopped with their back wheels digging in vigorously.

The only Morgan in the Scarborough M. and M.C.C. Trial making a good ascent of Grosmont Hill. The number of spectators from this sparsely populated district is worthy of note.

Plucky Lady Competitors.

Both the lady competitors made two attempts but were thrown each time, although they made clean ascents of Limber Hill, where nearly half the male competitors failed. Results:

CLASS 1 (275 c.c.).—1, Miss S. F. Wilson (2¼ Velocette), lost 22 marks, also winner of Miss Tranmer's silver cup; 2, W. G. Morris (2½ O.K.-Villiers), lost 35 marks.

CLASS 2 (350 c.c.).—1, G. E. Jackson (3½ Beardmore-Precision), lost 30 marks; 2, N. Atkin (2¾ Wooler), lost 40 marks; 3, G. F. H. Gardiner (3½ Armis), lost 50 marks.

CLASS 3 (1,000 c.c.).—1, H. E. Ellis (4¼ B.S.A.), lost 1 mark; 2, F. Blackburn (3½ N.U.T.), lost 4 marks; 3, N. L. Lowson (4¼ B.S.A.), lost 5 marks.

CLASS 4 (600 c.c., Sidecars).—1, D. Brigham (4 Triumph sc.); 2, J. Pickering (4 Triumph sc.); 3, A. O. Brett (3½ Coventry Eagle sc.).

CLASS 5 (1,100 c.c., Passenger).—1, C. W. Mosey (5-6 A.J.S. sc.), lost no marks and also won the silver cup for best performance; 2, A. E. Tindall (7-9 Harley-Davidson sc.), lost 5 marks; 3, E. F. Warters (10 G.N.), lost 12 marks.

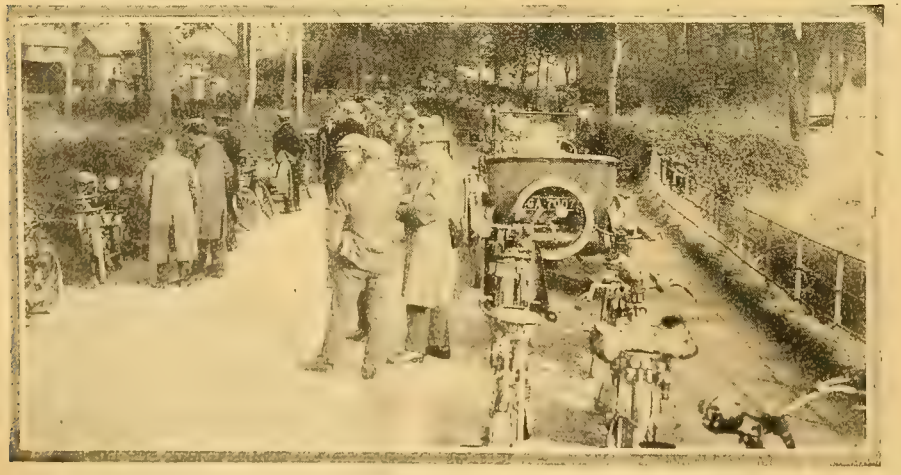
Hill-climbing near Glasgow.

The Western M.C.C. Open Hill Event at Garshake.

GARSHAKE is a popular hill with all the motor cycle clubs around Glasgow, but yesterday's meeting surpassed all previous events. There were twenty classes, and over 130 starters.

At the invitation of the officials, H. R. Davies gave exhibition rides in several of the classes on his 2¾ h.p. A.J.S. He was the chief attraction in an afternoon full of incident, making faster time than any of the competitors, some of whom were riding 7-9 h.p. machines.

Napier-White (3½ Edmund) settled his account for the time being with J. W. Walker (3½ Norton), who had rather bad luck at the start owing to skid. W. G. Smith, with his 1914 2¾ Ivy Green, made a fine climb in the private owner's solo class, while A. H. Alexander's 3½ h.p. Douglas was in good form. Douglas Alexander, who had the misfortune to crack his front cylinder head before the event, was not to be denied his place in the sun, and though handicapped by loss of compression he, nevertheless, made fastest time of the day and won the solo unlimited class. The results of the various classes, both on time and formula, are as follows:



At the foot of Garshake Hill, where the Western M.C.C. held their open hill-climb

CLASS 6.—350 c.c. SOLO (OPEN). ON FORMULA.

	Time, sec.	Fig. of Merit.

Speed Hill-climbing at Evesham.

Nearly 45 m.p.h. on 1 in 6 from Standing Start in Worcester Club's Event.

Eric Williams (2¾ A.J.S.) making a fast ascent of Hipton Hill in the Worcester M.C.C. hill-climb

BOSTON and Davies, and Davies and Boston. That, as so often before, sums up the very successful hill-climb of the Worcester M.C.C. at Hipton Hill, Evesham, on September 30th. But although the times of the A.J.S. experts are 5s. lower than the best general time, it must be remembered that all was in favour of the light machine that could accelerate rapidly.

The course was exactly three-tenths of a mile with a maximum gradient of 1 in 6, and was at least 1 in 15 at the starting-point. Combined with a loose patch at the top and a standing start, conditions seemed all against high speeds; yet the average of all the competitors works out at about 35 m.p.h.

The Lightweight Chassis.

Reg. Brown, on a very lively 2¼ Diamond, made the star ascent in Class 1, although J. M. Dosher (2¼ Enfield) was good in the general class. This latter rider, by the way, came up, in all, ten times, clocking very consistently around 40s.

But it was in the next class that the spectators on the bank instinctively drew back, as H. R. Davies and G. S. Boston flashed by. It is difficult to differentiate between these two, although Boston made the faster ascent here by ⅗s., for they both piloted their bucketing mounts with the skill born of much experience. Eric Williams also on an A.J.S. did not seem quite happy with his mount.

Duel for Fastest Time.

Class 3 made eligible Reg. Brown, this time on a Sunbeam, and a trio of local Norton riders, all of whom did well. But the A.J.S. men easily held the leading places and kept things lively with a personal duel for fastest time. This was settled in the unlimited class when Davies and Boston both clocked 25s., making fastest time of the day and fairly indicating their comparative performances. G. R. Main (8 Zenith) in the course of a very clean climb achieved the fastest ascent in the general classes, while W. E. Smith (3½ Norton) ran him very close.

Generally speaking the passenger classes were a repetition of the solo events; but special mention must be made of the climbs of some of the heavier outfits, especially Mrs. Gibbs (3½ Sunbeam) and B. Bladder (8 New Imperial). The above lady, we are told, is a beginner to the pastime; but the manner in which she roared up on full throttle and second gear was more reminiscent of an expert.

The event was excellently organised; from the timing by field telephone to the arrowing of the route to the hill nothing was left to chance; and for a mid-week event the attendance of competitors and spectators was excellent. The results, on time, follow:

CLASS 1 (300 c.c., Solo).—Expert: 1, Reg. Brown (2¼ Diamond), 35⅘s.; 2, J. M. Dosher (2¼ Enfield), 40⅘s. General: 1, J. M. Dosher (2¼ Enfield), 39⅘s.

CLASS 2 (350 c.c., Solo).—Expert: 1, G. S. Boston (2¾ A.J.S.), 25⅘s.; 2, H. R. Davies (2¾ A.J.S.), 26⅘s.; 3, E. Williams (2¾ A.J.S.), 28⅘s. General: 1, J. M. Dosher (2¼ Enfield) and A. D. Thomas (2½ Diamond) tied, 42s.

CLASS 3 (600 c.c., Solo).—Expert: 1, H. R. Davies (2¾ A.J.S.), 25⅘s.; 2, G. Boston (2¾ A.J.S.), 26⅘s.; 3, Reg. Brown (3½ Sunbeam), 27⅘s. General: 1, W. E. Smith (3½ Norton), 31⅘s.; 2, T. Cullis (3½ Norton), 33s.; 3, G. J. Baragwanath (4 Triumph), 34s.

CLASS 4 (Unlimited Solo).—Expert: 1, G. S. Boston (2¾ A.J.S.) and H. R. Davies (2¾ A.J.S.) tied, 25s.; 2, E. Williams (2¾ A.J.S.), 28⅘s.; 3, Reg. Brown (3½ Sunbeam), 28⅘s. General: 1, G. R. Main (8 Zenith), 29⅘s.; 2, W. E. Smith (3½ Norton), 30⅘s.; 3, T. Cullis (3½ Norton), 32⅘s.

CLASS 5 (350 c.c., Sidecar).—Expert: 1, G. S. Boston (2¾ A.J.S. sc.), 29⅘s.; 2, H. R. Davies (2¾ A.J.S. sc.), 31⅘s.

CLASS 6 (600 c.c., Sidecar).—Expert: 1, H. R. Davies (2¾ A.J.S. sc.), 29s.; 2, G. S. Boston (2¾ A.J.S. sc.), 29⅘s. General: 1, F. Drew (3½ N.U.T. sc.), 61⅘s.

CLASS 7 (Unlimited Sidecars).—Expert: 1, H. R. Davies (2¾ A.J.S. sc.), 28⅘s.; 2, G. S. Boston (2¾ A.J.S. sc.), 30s.; 3, Reg. Brown (3½ Sunbeam), 33⅘s. General: 1, R. Bladder (8 New Imperial sc.), 38⅘s.; 2, J. M. Dosher (8 Enfield sc.), 42s.

P. V. Cunningham (3½ P. and M.) about to start on an A.C.U. observed test of consumption and mechanical lubrication. Approximately 144 m.p.g. (petrol) and 1000 m.p.g. (oil) were obtained with standard gears and an Amac carburetter.

D. R. O'DONOVAN AGAIN BREAKS RECORDS.

Six More Records taken by a Standard B.S. Norton.

RIDING a standard Brooklands Special Norton, D. R. O'Donovan beat six more records last Thursday. Previously held by J. Emerson (A.B.C.), the captured records are for 200 and 250 miles and three hours in Classes C (500 c.c.) and D (750 c.c.). Some time was lost by belts leaving the pulleys owing to the state of the track. O'Donovan also stopped with plug troubles during the last hour. The equipment included Dunlop tyres, John Bull belts, Binks three-jet carburetter, Speedwell oil, C.A.V. magneto, and Philipson pulley.

The new figures are as under:

		m.p.h.
200 miles	3h. 8m. 33s. ...	= 63.44
250 miles	3h. 56m. 34⅖s. ...	= 63.40
3 hours	190 miles 1,605 yards	= 63.63

Meeting of the A.C.U. General Committee.

Important Club Matters under Discussion.

FOLLOWING the proposal agreed upon at the end of last year to hold most of the General Committee meetings of the Auto-Cycle Union in the provinces the third session of 1920-21 was held at Norwich on Friday last.

On the evening previous to the meeting the committee was entertained right royally by the Norfolk Motor Cycle and Light Car Club. Some twenty members of the committee were present, and among those at the high table were the Lord Mayor of Norwich, Mr. W. R. R. Spelman, president of the club, the Town Clerk, the Chief Constable, the County Surveyor, and Commander Windham, R.N., the prospective Parliamentary candidate for Great Yarmouth. Considerable credit is due to Mr. R. A. Lower, the A.C.U. consul in Norwich, for his organisation of the meeting, and to the Norfolk club. The speeches at the dinner were brief and to the point. After the proposal of the toast of the King by the President, Mr. W. R. R. Spelman, he proceeded to welcome the visitors to the City of Norwich. He then referred to the history of the club which had renewed its activities during the present season. He greatly regretted that the chief constable of Yarmouth had been unable to attend, as the club owed him a real debt of gratitude, for helping it to organise their most successful speed trials at Yarmouth. He hoped that it would be possible to organise an open event next year.

Value of Provincial Meetings.

Col. Davidson, in reply, spoke of the importance of provincial meetings, especially in such places as Norwich, where the Auto-Cycle Union was not too well known. After such hospitality as that proffered by the Norfolk M.C. and L.C.C., he felt it would be difficult to refuse them anything.

Mr. T. W. Loughborough, in proposing the city of Norwich, made a most able speech. He said the A.C.U. as the governing body, sought to govern by encouragement. The sporting side of the Union's work was not the most important side, but the nature of its work was not sufficiently well known, and that was why provincial meetings were organised.

The Lord Mayor replied with a very amusing speech.

In a charming speech Col. Brereton replied to the toast of the Norfolk M.C. and L.C.C., referring to the enterprise of the president; the amusing speech of the Lord Mayor; the wisdom of the chief constable, who had whispered to him that there were no traps in the county (cheers); the prowess of Mrs. Knowles (who was present) in the Six Days Trials; and the good fortune of the club in possessing such a good organiser as Mr. Lower.

Mr. R. O. Clark was then called upon by Mr. W. H. Wells, who said he had ridden one of the finest races in the Isle of Man he had ever witnessed.

Mr. Clark, in reply, said he hoped to see several members of the Norfolk Club in the Isle of Man next year.

The General Committee Meeting.

On the following morning the General Committee sat for two and a half hours, and was attended by a representative gathering at which a considerable amount of business was transacted. The first important item on the agenda was the reception of the reports of various management and sub-committee meetings, and in these the chief points to arise were the following: It was announced that the Union was preparing a booklet to explain the procedure to be followed by motor cyclists when the new taxation came into force. Mr. Wells suggested that the Government should follow the example adopted in America of issuing identification plates, which would, of course, be of the correct dimensions, and there could be no question of number-plates being illegal. People would then know where they were, and the number-plate would also show that the local taxation licence had been paid.

As regards the Competitions Committee reports, considerable discussion ensued as to the existing Tourist Trophy rules which allowed a competitor to push his machine over the finishing line and win, even though his engine was not working. It was felt, however, that no useful purpose would be served by altering the existing rule. In fact the only addition to the existing regulations was to add a rule to the effect that a competitor may have to undergo a medical examination, and would not be allowed to ride if an adverse report were received.

Many Applications for Affiliation.

It is gratifying to note that applications for affiliation to the governing body are still numerous. At Friday's meeting the following clubs allied themselves to the Union: The Coventry and Warwickshire M.C.C., the Grantham and District M.C. and L.C.C., the Mansfield and District M.C. and L.C.C., the Market Harborough and District M.C.C., the Millom and South Cumberland M.C.C., the Montgomery County M.C.C., the Nomad (London) M.C.C., the Stockport Motor Club, the Blackpool and Fylde M.C.C., the Southport M.C.C., and the Norfolk M.C. and L.C.C.

A proposal appeared in the name of Major Vernon Brook, which was taken charge of by Mr. Quintin Nicol, dealing with the question of amending the local centre byelaws so as to prevent the overlapping of these centres, and the formation of these bodies without the consent of the General Committee. The matter was finally settled by amending the local centre byelaw No. 1, which now reads:

"The committee of the Auto Cycle Union, hereinafter termed the Union, shall define the area of each territorial district, which shall be called a local centre of the Auto Cycle Union, and shall be constituted in the manner hereinafter provided.

"A local centre shall not be formed in any district until at least six affiliated clubs in that district shall have made written application to the Union stating the district proposed to constitute such centre, and obtained assent thereto."

Mr. Nicol then proposed that "The application for the formation of 'The Three Shires Centre' be acceded to."

"Three Shires" and Midland Centres.

The matter in question was discussed for some time, as it was not apparently fully understood by the Midland Centre now in process of formation. It must also be explained that the "Three Shires Centre" comprises the Worcester, Hereford, and Gloucestershire M.C.C. The proposal was agreed to, subject to an agreement being reached with the proposed Midland Centre as to the limitation of their respective areas, those areas to be agreed upon in consultation with the Management Committee next meeting.

Apropos the matter of competitions it was proposed by Mr. Wells, and seconded by Mr. J. L. Norton, that there should be twenty open competitions in 1921, exclusive of those organised by the Auto-Cycle Union and at Brooklands. This was carried unanimously, with the slight amendment that eighteen permits should be issued, and two held in reserve.

Dr. A. M. Low then announced that the Hon. M. Upton had offered a valuable cup for the best performance at a silencer trial to be held in the near future at Brooklands. He suggested that the machines (divided into standard and experimental classes) should be sent up Brooklands test hill on low gear and on full throttle, and that the noise of their exhaust should be recorded photographically. The judges of the competition should include a representative from Scotland Yard.

Autumn Coast Ride Completed.

Officially-observed Trial of 3,315 Miles with a 500 c.c. Wilkin Sidecar.

THE officially observed coast ride undertaken by J. W. Wilkin was completed last Friday at 11-40 p.m. when the 4 h.p. Wilkin-Blackburne drew up at Blake's showrooms from which it had started thirty-two days before.

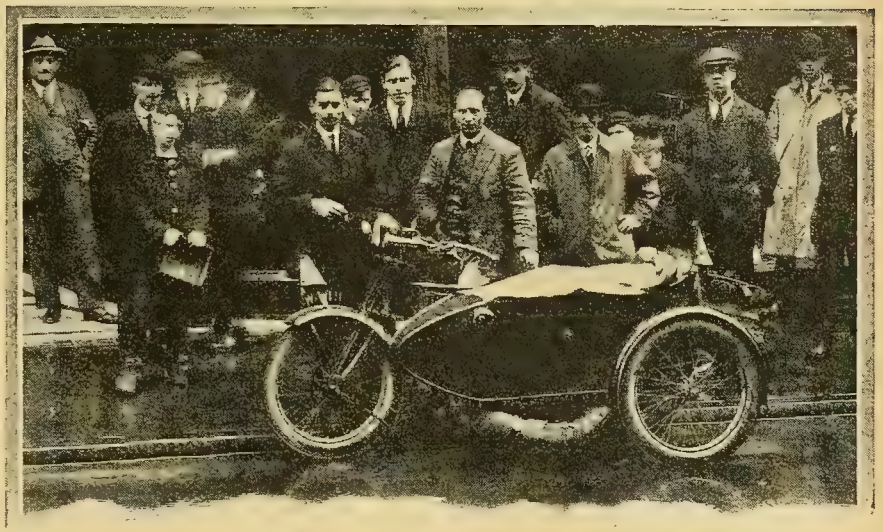
In all, 3,315 miles have been covered, the daily average being 160 miles. The first day—Liverpool to Barrow (112½ miles)—was the lowest, and from Grimsby to Yarmouth (235 miles) the highest.

Starting from Liverpool on September 8th, the route was *via* the West and North Coast of Scotland to John-o'-Groat's, down the East Coast of Great Britain to Tilbury Docks, along the South Coast to Land's End, then *via* the Welsh Coast to Liverpool. The coast line was followed wherever there was anything in the nature of a road. Often this was nothing more than a right of way, and from Dumfries to Thurso the machine had to travel over stones and boulders, which the machine withstood remarkably well. This was described as the worst stretch of road. At Scourie, in Scotland, it was found that the ferry had been out of commission for twelve months. However, the ferryman raked up a craft of some description and got them across.

Twenty-one Days on the Road.

The actual travelling days numbered twenty-one, and on two days the rain was so heavy that no mileage was made, and the motor cyclists remained at Grimsby and Yarmouth respectively. During the first fortnight there was incessant rain, and the rider declared that the journey over the noted "Rest and be Thankful" hill would have been impossible had it not been for the chain drive.

In the early part of the journey the driver wore out his waterproof suit, and brought back to Liverpool, strapped on the sidecar, a pair of tight-fitting fishermen's boots which he bought up in the North. Although a few spare valve parts were carried, replacements were surprisingly few, the tyre troubles consisting of five punctures (two in sidecar tube) and a leaking valve. The carburetter and magneto were faultless, and did not require a moment's attention during the whole of the journey. The chain, however, had to be adjusted. The severe bumpings the machine received caused the rope attachments holding the spare tyre beneath the sidecar to be cut, and the wheels must have passed over the tyre, which was lost without it being noticed.



The finish of the 3,315 mile coastal ride. J. W. Wilkin, who rode a Wilkin and sidecar, is seen standing in the centre, with the A.C.U. observer at his right hand.

Bitter complaints were made of the terrible roads. An attempt was made to get over the Beggar's Roost in Devonshire, but the wheels could not get a grip on the loose surface, and the venture was abandoned. Without passengers, the outfit weighed 4¼ cwt. and its load 22 stone. The average petrol consumption was roughly 65 m.p.g., and oil about 800 m.p.g. A feature of the cycle is the 7½in. mudguards.

The only actual damages to the machine were a slightly fractured rear fork stay and a broken exhaust pipe, which, considering the hundreds of miles of execrable roads, is not a formidable casualty list. An A.C.U. observer occupied the sidecar throughout the long ride.

We congratulate Mr. Wilkin on the completion of his test. A coast ride with a 500 c.c. sidecar at this time of the year is no mean performance, and is one which places this comparatively new make in the category of machines which have been tried and not found wanting.

We Must Have Home-produced Fuel!

ARE we to have an adequate supply of power alcohol? The campaign carried out for several years by *The Motor Cycle* and its sister journal *The Autocar* is at last bearing fruit, for there are many indications of activity which, combined, may convince the Government that a home-produced fuel is an absolute necessity.

The A.A. is making a special effort to organise deputations to the mayors of all the chief towns and cities with a view to bringing before the notice of the Prime Minister the fact that the price of petrol is no longer a matter of motoring costs, but a national affair affecting all classes of the community.

Power alcohol seems to be the ultimate solution to the problem of Great Britain's fuel supplies. This spirit, if mixed with benzole, can be used in existing engines, though if alcohol alone be used a certain amount of modification will be necessary.

A practically unlimited supply of power alcohol is obtained from vegetable sources, and here is an opportunity for the Government to open up a vast industry in the Overseas Dominions. In Africa, India, or many of the Tropical possessions alcohol can be manufactured from refuse molasses, maize, potatoes, mahua, and many different vegetables. Something must be done *at once*. This country must be independent of supplies from countries which at any moment may prohibit exports on account of shortage.

It is impossible to exaggerate the urgency of this vital question. *We must have home-produced fuel*, by which is meant a source of supply within the Empire and outside the control of foreign trusts.

Already, as was reported in our last week's issue, deputations organised by the A.A. have been before the Mayor of Coventry and the Lord Mayor of Birmingham. Other deputations are being arranged, while the resolution proposed at Coventry last week is being circulated throughout the city councils of the country.

Club News

Oxford University M.C.C.

The hon. secretary of the Oxford University M.C.C., Mr. J. E. G. Harwood, requests that all communications in future should be sent to him at Christ Church, Oxford, and not to his former address.

Bridgwater and District M.C.C.

The following are the results on time of the hill-climb on Puritan Hill :

600 c.c. (Club).—1, T. House (4 Triumph), 42⅘s.
1,000 c.c. (Club).—1, C. A. Pollard (8 Zenith), 35⅘s.
1,000 c.c. Sidecar (Club).—1, C. A. Pollard (8 Zenith sc.), 45s.
350 c.c (Open).—1, R. Passey (2¾ Douglas), 42⅘s.
600 c.c. (Open).—1, G. H. Tucker (3½ Norton), 36⅘s.
1,000 c.c. (Open).—1, C. A. Pollard (8 Zenith), 34⅘s. (fastest time of day).
600 c.c. Sidecar (Open).—1, E. Kickham (3½ Douglas sc.), 40⅘s.
1,000 c.c Sidecar (Open).—1, E. Kickham (3½ Douglas sc.), 39⅘s.

Levis Athletic Club.

The full results of the recent trial for Levis machines only, reported in our last week's issue, are now to hand :

Winner of Yardley Cup and gold medal for best performance of the day: G. S. Davison, 192 marks.
Silver medal for best performance in Class B: W. S. Hawcutt, 164 marks.
Silver medal for best performance in Class C: Gem Smith, 137 marks.
Bronze medal for second best performance in Class A: Fred Porter, 172 marks.
Bronze medal for second best performance in Class B: F. Proctor, 125 marks.
Bronze medal for second best performance in Class C: C. L. Hull, 129 marks.
Special prize for worst performance of the day: J. Pritchard, minus 2. (Note.—The term "worst performance" is somewhat of a misnomer, but Pritchard qualifies for this prize, as he lost more marks than anyone else who covered all the course. Only fifteen riders actually covered the complete course. Most of the riders who were "disqualified" or "retired" made far worse performances than Pritchard, one actually having lost 252 marks in spite of not having travelled the whole route.)

Lancaster, Morecambe, and District M.CC

This North Lancashire club recently held very successful speed trials on Morecambe promenade during the Morecambe Carnival. About 2,000 spectators witnessed the racing, which was favoured by splendid weather. Several well-known speedmen were competing, including T. C. de la Hay, the winner of this year's Senior T.T. ; L. Mitchell, who has worked his way into the front ranks this year; and J. Whalley, another Lancashire rider of promise. The length of the course was one kilometre, and competitors had a flying start. Following are the results :

CLASS 1 (machines not exceeding 350 c.c.).—1, M. Parkinson (2¾ Douglas), 35⅘s.; 2, B. Houlding (2¾ Douglas), 36⅘s.
CLASS 2 (machines not exceeding 500 c.c.).—1, T. C. de la Hay (3½ Sunbeam), 30⅘s.; 2, L. Mitchell (3½ Norton), 31s.
CLASS 3 (750 c.c.).—1, T. C. de la Hay (3½ Sunbeam), 31s.; 2, L. Mitchell (3½ Norton), 31⅘s.
CLASS 4 (unlimited).—1, L. Mitchell (3½ Norton), 31⅘s.; 2, T. C. de la Hay (3½ Sunbeam), 32s.
CLASS 5 (Local, 550 c.c.).—1, J. Whalley (3 A.B.C.), 35s.; 2, E. Varley (3½ Norton), 35⅘s.
CLASS 6 (Local, unlimited).—1, J. Whalley (3 A.B.C.), 34s.; 2, E. Varley (3½ Norton), 34⅘s.

A stiff route of approximately one hundred miles through the Lake District made the recent one-day trial of this club a severe test. The results are as follows :

SOLO MACHINES.—1, W. Aitkinson (3½ B.S.A.); 2, E. Threlfall (4 Triumph).
SIDECARS.—1, R. C. Ducksbury (8 Clyno sc.) and C. E. Barron (6 A.J.S. sc.) tied.
TEAM PRIZE.—G. W. Read (6 A.J.S sc.) and E. Threlfall (4 Triumph).
Special medal for best performance on hills, E. Threlfall (4 Triumph).

Hastings, St. Leonards, and Bexhill M.C.C.

The Hastings, St. Leonards and Bexhill M.C.C. propose to promote an inter-club trial on October 24th, over a radius of about fifty miles from Hastings. The club would be glad to hear from local motor cyclists who would care to give assistance as observers on this occasion. These should communicate with Mr. J. Blakemarsh, 243, London Road, St. Leonards-on-Sea.

N.M.C.F.U. (Wolverhampton).

For the final run of the season on Saturday, the 25th ult., it had been hoped there would be a good muster. The fact, however, that several members were on holiday, and that others could not resist the attraction of football, probably accounted for the small attendance —eight members only, in place of the usual average of upwards of thirty. These faithful ones had their reward in ambling through the charming lanes in the vicinity of Gailey Pools on a glorious afternoon, and finally making their way *via* Stretton to Brewood, where tea was enjoyed in a cosy nook near the canal, after which a run home *via* Boscobel and Codsall Wood completed a most pleasant outing.

Luton and South Beds A.C.

On the occasion of the hill-climb on the 9th competitors will be weighed at Luton borough weighbridge, and not at Wendover, as previously stated.

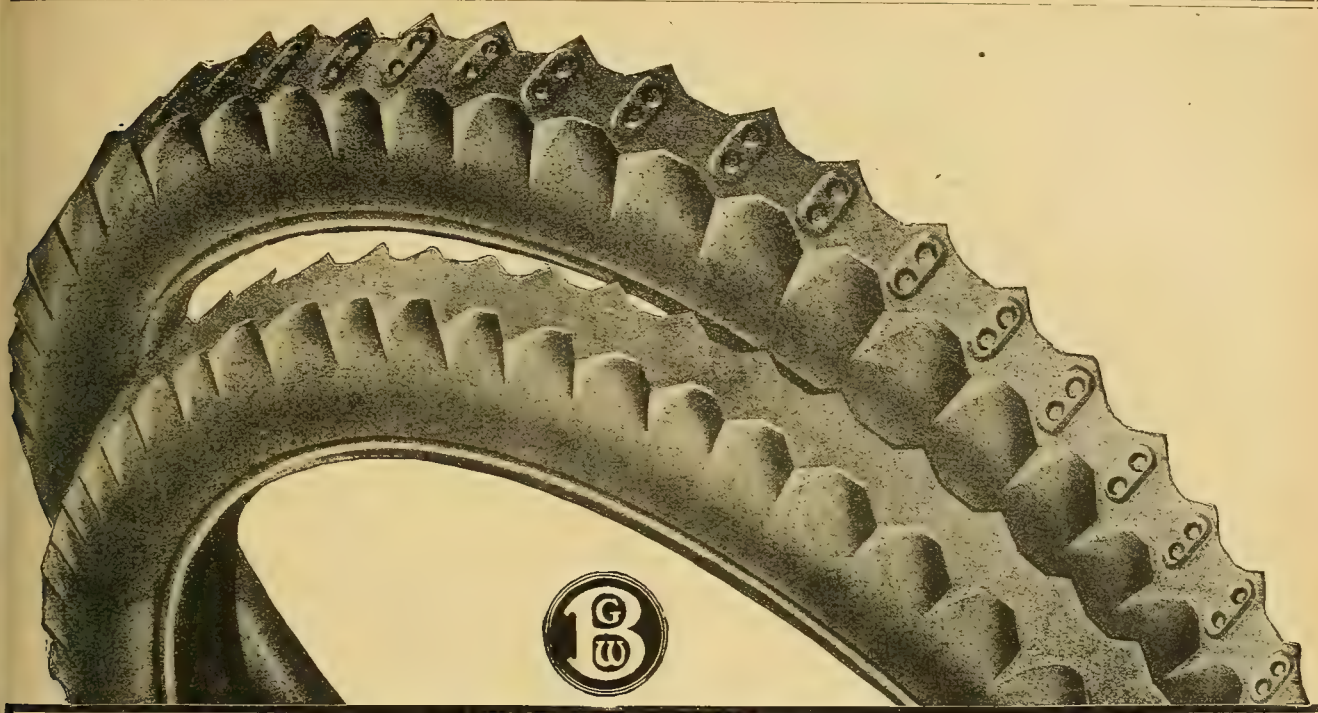
Dewsbury and District M.C.C.

The above club held a speed testing competition on September 26th, over a thirty miles course. Secret checks were arranged at intervals around the course, and one mark per minute was deducted early or late at these checks. The following were the winners : 1, Special Pelican prize, C. L. Owen (3½ Rudge-Multi); 2, Lumb prize, H. Haley (Matchless sc.).

North London M.C.C.

Essenden, on September 25th, witnessed the North London M.C. Club's speed-judging trial; and, as usual, the consistent times evoked many queries and suggestions as to how it was done. The brainy man who suggested covering up the various village clocks was quite eclipsed by one who declared that next trial he would take his time from his drip-feed! Three circuits of the course were made, and competitors were allowed to select any speed between 15 and 20 m.p.h. C. C. Labin (4 Indian Scout) completed his first and second circuits in exactly the same time, a feat which made him unanimous favourite with the spectators. But like so many favourites he was unplaced, finally, the following being the prize winners: 1, Silver medal, R. H. Baxter (2¼ Radco), 1m. over; 2, bronze medals, R. H. May (4¼ B.S.A.), 1½m., and J. D. Timmins (1 Miniature Scooter).

Two thousand spectators witnessed the speed trials organised by the Lancaster, Morecambe, and District M.C.C., and held during Carnival Week on the promenade at Morecambe.



BELDAM

All British Motor Cycle Tyres.

BELDAM Tyres are NOT easily punctured; they do not skid; they give magnificent mileage. We can prove these claims by the number of testimonials we hold from experienced, unprejudiced, motorists.

Beldam Tyres are as well and truly made as any tyres in the world. We do not ask you to use them for that reason alone—but for their long wearing, anti-skidding, and puncture resisting qualities. There are two types for Motor Cycles—both of which are here illustrated—and four types for Motor Cars. They can be had in all standard sizes. Booklets free on request.

SIZES	ALL RUBBER DE LUXE						V STEEL STUDDED

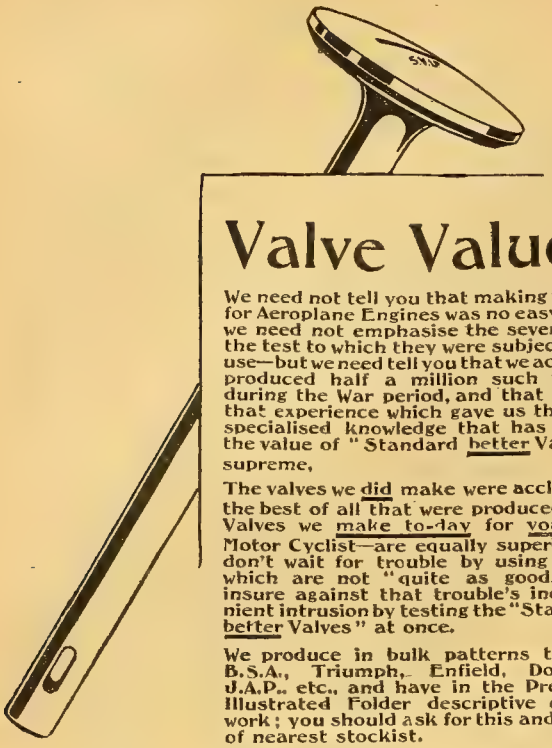
Manchester: W. Briggs & Co., Bazaar Street, Pendleton. Nottingham: The City Rubber Co., 106, Upper Parliament Street. Colne, Lancs.: G. W. Rushworth, Brown Street. Northumberland: R. Y. McIntosh & Co., 13, Shakespeare Street, Newcastle-on-Tyne. Scotland: Drysdale & Co., York Place, Dumfries. Ireland: Vickery's Bantry Motor Garage Co., Bantry.

Retreads.

Good work—the best obtainable—and the best materials go to the making of Beldam Retreads—same workmanship and materials as Beldam Tyres. That is why they last so long—why they are such a good investment. The majority of Beldam Retreads are good for 5,000 miles—some have run for 7,000. Send old covers—any make—and we will quote cost of repairs or retreading

Godbolds.



Valve Values

We need not tell you that making valves for Aeroplane Engines was no easy job—we need not emphasise the severity of the test to which they were subjected in use—but we need tell you that we actually produced half a million such valves during the War period, and that it was that experience which gave us the very specialised knowledge that has made the value of "Standard better Valves" supreme,

The valves we did make were acclaimed the best of all that were produced—the Valves we make to-day for you—the Motor Cyclist—are equally superior, so don't wait for trouble by using those which are not "quite as good," but insure against that trouble's inconvenient intrusion by testing the "Standard better Valves" at once.

We produce in bulk patterns to suit B.S.A., Triumph, Enfield, Douglas, J.A.P., etc., and have in the Press an Illustrated Folder descriptive of our work; you should ask for this and name of nearest stockist.

Strength
—where strength is wanted

Your Motor Cycle will be stronger and will yield a longer and more satisfactory service if the frame is built up with

REYNOLDS' BUTTED TUBES.

These famous tubes give added strength to the frame's most vital parts—"the joints"—and a rigidity and strength to the whole machine which adds immeasurably to the rider's comfort.

And the winning of the 1920 Senior T.T. on a "REYNOLDS - Butted - Tube - built" machine is the latest "merit proof."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

F.R.S.
LAMPS AND GENERATORS
HOLD WORLD'S RECORDS.

LIGHTING SETS
£6 5 0

Here's a new and economical method of lighting—the F.R.S. Magneto Electric Set—which enables the excess current produced by the magneto to be utilised for lighting. Simple, reliable, foolproof.

Cuts out the trouble of lighting up—directly the engine starts the lamps light. An accumulator is fitted into box for use when machine is standing.

There's no loss of engine power and no damage to magneto. Ask your agent to show you the F.R.S. Magneto Set—then decide to fit it and save lighting costs. Write for list.

Pershore Street,

[2688

YOU CAN STICK

a pair of Ustikon Soles to your shoes as easily as you can stick a stamp on your letters. No tools are required, neither screws nor rivets. The method is simplicity itself. What can be easier?

Surely in these days of high prices Ustikon Soles are worth consideration. You save money on every shoe so repaired and get double the wear at half the cost. Once you have fitted you will readily appreciate the economy.

DAVIS

MOTOR CYCLES FOR SALE.

Triumph.

TRIUMPH 1920 Combination, Gloria sidecar, lamp horn, speedometer, spares, perfect condition mileage about 2,000; £150. — Dering, Woodwater Heavitree, Exeter. [34

TRIUMPH, 4h.p., Model H, 3-speed countershaft kick starter, entirely renovated by makers, new, just delivered; £105.—Eagles and Co., 275, High St., Acton, London. [X40

WILL sell 1919 4h.p. T.T. Triumph motor cycle new back tyre, Tan saddle pillow seat, very fine splendid hill-climber, perfect; price £100.—S., Fileigh, Warberries, Torquay. [26

1919 Countershaft Triumph, Millford Corvette sidecar, Cameo, Tan-Sad, lamps, horn, 1,800 miles new condition; £135, or nearest offer.—16, Devonshire Place, Handbridge, Chester. [28

1918 Triumph Countershaft Combination, enamel and plating unscratched, P. and H. lamps, etc.; £120 exchange modern 2-seater, cash adjustment.—72, Lonridge Rd., Earl's Court, S.W.5. [31

1913 Triumph Coachbuilt Combination, waterproof Bosch, mag., splendid condition and running order, Canoelet sidecar; £65; exchange lightweight and cash.—34, Ampthill Rd., Bedford. [25

TRIUMPH 1918 Countershaft Combination, electric lighting, C.B., screen, £20 worth spares, plated as new, splendid condition; £105; any trial.—Blo Rosemary Lane, Richmond, Yorks. [28

1920 Triumph, Model H, with Canoelet sporting sidecar, mileage 2,500, fully equipped, many spares, perfect condition; seen by appointment; £14 —Hall, 77, Crown Rd., Twickenham. [30

1917 4h.p. Triumph, 3-speed, countershaft, lamp P. and H. lamp, special long exhaust pipe horn, spare belt, good tyres, condition good; £87, best offer.—Willoughby, Merstham, Surrey. [30

1920 Triumph, coachbuilt sidecar, electric horn and lights, speedometer, long exhaust, Ace discs, wind screen, luggage grid, guaranteed perfect, hardly used spares; £145.—Bruce, Crispham, Buxted. [34

NEW Triumph 1920 4h.p., countershaft model, list price; £127/10; in stock.—Cambridge agents for Triumphs, Herbert Robinson, Ltd., 32-35, Green St., Cambridge. T.A.: Bicycles. Tel.: 995. [29

1920 Triumph, countershaft, all-chain drive, fitted luxurious bulbous sidecar to match, brand new and unregistered; £175; exchanges or easy payments.—2, Nightingale Rd., Lower Clapton. [35

TRIUMPH Model H. (Jan., 1920), Lucas lamp, electric rear, Klaxon, A.K. grips, Tan-Sad, large sprocket, spare valves, etc.; £100, or reasonable offer considered.—Brian Astle, Copperfield, Bickley. [33

1920 Triumph Combination, limousette sidecar hood, screen, Cowey speedometer, large tank set, horn, tools, new, used few times; quick sale £159.—365, King St., Hammersmith, W.6. [29

TRIUMPH, 1920, delivered September, Fulford sidecar, Lucas lamps and horn, Cowey speedometer special mudguards; cost £190, will take £170 cash Write Oscard, c/o Post Office, Stoke-on-Trent. [31

TRIUMPH, 1913, 3½h.p., 3-speed, clutch, thoroughly overhauled, repainted latest colour, as new, 19 bars, C.B. sidecar, 3 lamps, Klaxon, spares, tools; s and trial any time.—Bond, 23, Applegarth Rd., W.1 [31

COUNTERSHAFT Triumph Combination, Bram sidecar, leather upholstered, roomy, wind scre apron, lamps, tools, accessories, perfect condit throughout, mileage under 1,000, any trial.—Haw Baker, Tring. [28

TRIUMPH 1920 4h.p. Motor Cycle, with Triumph sidecar, Lucas head, rear, and sidecar lam horn, Cowey speedometer, hood cover, and wind scre indistinguishable from new; £190.—Parker's, Bradsh gate, Bolton. [X40

1918 Triumph and 1920 Foxton Sidecar. P.I. lamps, Klaxon, new tyres, spare belt, cover, t valve, fully insured; £120; first-class lightweight sidered as part payment.—4, Waterside, Evesh Worcestershire. [2

1919 (Nov.) Triumph and Henderson Lightwei Sidecar, first used March, 1920, mileage 2,0 P. and H. lamps, Klaxon, tools, spares, excellent dition; trial, £125.—Mighell, Manor Farm, Bedding Croydon, Surrey. [2

TRIUMPH Combination, 1917, coachbuilt side 3-speed countershaft, electric lighting, spe meter, Easting, tools, pump, 2 spare tubes, insure policy, three months old; price £130.—Apply, Buckingham Place, Brighton. [2

1920 Triumph 4h.p. and Gloria De Luxe Side electric light, speedometer, screen, hood, spa all tyres perfect, condition excellent, going abroad, sell quick; £135, or any reasonable offer.—West Moreton Gardens, Old Brompton Rd., S.W.5. [2

TRIUMPH, 1920 model, in stock, £127/10; Triumph renovated model, £105; makers' price; half down and 11 payments.—Lamb's, Euston Rd., London, N.W. 151, High St., Walthamstow; and 50, High Rd., Wood Green, N. [2

1919 (Nov.) 4h.p. Triumph Combination, per condition, electric lighting, tyres excel (back tyre unused), splendid Henderson Elite sid whole outfit looks just like new; £130.—E. F. Da Duncan Fox and Co., Cunard Building, Liverpo [2

Only Threepence!

ONE can hardly rejoice over a fall of a mere threepence in the price of a gallon of petrol. It was raised—unjustifiably many people think—no less than eightpence a few weeks ago, so petrol is still fivepence dearer than it was in August. As a matter of fact, the threepence reduction applies to England and Wales only; in Scotland and Ireland the drop is but twopence. There is a general slump in America, where prices of all commodities are tumbling down. It is said that America cannot absorb the increased quantity of spirit produced in the States. As a result British figures are reduced. This explanation hardly coincides with recent reports which urged that the increase in the number of motor vehicles was easily outstripping the petrol available. In a week or so the report of the Sub-committee of the Central Profiteering Committee regarding the excessive cost of petrol will be available and should form interesting reading. The plain fact is that petrol to-day costs far more than double its pre-war cost, and the present high prices are exercising a hampering effect upon the motor industry and fostering unemployment. That is a question over which the directors of petrol companies should ponder. At one time it was thought that the National Benzole Association would ease the lot of the motorist, but price advances of this spirit have proved equally disappointing. *The Motor Cycle* has never ceased to advocate lower prices of motor spirit, and will continue that policy, at the same time doing its utmost to urge the production of alternative fuels, preferably home produced.

Until such times as the British Empire is self-supporting in the matter of liquid fuel, it is hopeless to expect anything but our present position of dependency. We must not be lulled into quietude because of a drop in price which may only be temporary; the alternative fuel demand is still insistent.

Racing Machines at Brooklands.

SHOULD racing machines invariably have brakes?

In view of the accident which took place at a recent B.M.C.R.C. meeting there were many severe comments on the advisability of allowing machines to compete which are unprovided with brakes, particularly in combination with the long finishing line. In our opinion the accident was due to the two causes. The rider of the machine committed an error of judgment in riding without brakes, and the track authorities were wrong to allow the long finishing line to be used in a race in which high speeds were expected. Had the racing taken place at the fork, as is the usual case when purely motor cycle race meetings are held, an accident of this nature could not have occurred.

It is all very well to argue that the speed was so great that brakes would cause skidding or could not have been used, but the winning machine was duly fitted with brakes, and its rider was only just able to turn the corner after applying them with all the force at his disposal. We certainly urge the track authorities to take steps to see that brakes of some kind are fitted.

The sister machine to the one used by the unlucky Harveyson was not only not fitted with any brakes but with no throttle, and the only means of stopping it was a handle-bar switch. The whole of the handle-bars were wrapped with insulating tape, except at the point where the switch contact had to be made. If by any chance the tape became frayed, or if for any reason good electrical connection could not be made between the handle-bar and the switch blade, the rider would have had no means whatever of stopping the machine.

No doubt the incident will ensure that, so far as is humanly possible, steps are taken to prevent the further occurrence of accidents of a similar nature, which cannot fail to mar these sporting meetings.

An Index to the advertisements in this issue will be found on the page facing the back cover.

What's Inside?

AT any hill-climb this season an observer who studied the crowd instead of the road could detect some curious expressions on the faces of the spectators. There is one particular stare, compounded of incredulity, envy, humiliation, and wonder which is frequently seen and might be termed the "How the deuce does he do it?" look. It serves to identify in the crowd men who own alleged duplicates of the 'bus on which a trade rider or a fellow clubman has just flashed up the hill at 60. Well, here is a hint. During the summer the firms who make a business of supplying aluminium pistons have done a lot of business amongst the sporting riders.

A Puzzle.

I HAVE just been consulted by a very perplexed rider indeed. After months of peace with a standard 3½ h.p. single-cylinder, trouble began by his magneto timing slipping, the taper mounting of the front sprocket being as usual the culprit. He was man enough to time his engine by the roadside even then (to anticipate a little, he is now a past expert at the job). Unfortunately, he did not tighten everything up quite as well as he could wish, and within a mile or two the job had to be done all over again, as everything whirred off. This time no tightening proved effectual, and the sprocket mounting was eventually re-ground to make a sounder job. The remedy acted like a charm, and the front sprocket has not slipped again. Unluckily trouble now occurs at the other end, for the key of the rear sprocket mounted on the camshaft shears every time he goes out. Without dismantling the parts in question it is, of course, impossible to make an exact diagnosis. But it is quite obvious that something is out of truth and throwing quite abnormal stress on the magneto transmission; the most likely troubles are an untrue sprocket or a bent armature spindle.

The Demand for Motor Cycles.

THE daily papers as usual are publishing not a little nonsense about the motor trade. The demand for motor cycles is still quite considerable, and—subject to the usual seasonal variations and sympathetic oscillations caused by national prosperity—it is going to remain far above old standards. The motor cycle is a necessity to some users, a luxury to others; in both aspects it is coveted by millions. This is the basic fact of the present situation. The subsidiary facts are two in number, and are often overlooked. First, new firms have rushed into the industry and old firms have planned outputs without any very statesmanlike forecast of the precise total demand to be experienced during 1920-1921. A considerable over-production was imminent, and is being dodged by the complete withdrawal of some firms and by reduction of output in other cases. Secondly, a commercial depression, which we all hope will only be temporary, has made money very tight, thereby exaggerating the usual autumn decrease in orders, and simultaneously strangling firms who were subsisting more or less on credit until such time as they should have recouped the huge outlay which figured in their post-war reconstruction. If general trade prosperity should return in the spring, we shall experience a boom rather than a slump in motor cycles. If the general trade depression is long drawn out, the luxury section of the motor cycle market will languish, as all luxury markets languish in hard times.

Oil in Bulk.

THOUGH we motor cyclists often complain because we are compelled to buy our petrol in a fiddley and wasteful manner, comparatively few of us study the irrefutable logic of Prices' advertisements and buy our oil in bulk. Personally I have followed their sage counsel for many years past, and the resultant saving on the oil bill varies from 25 to 50%. Tins are very costly nowadays, and, besides being non-returnable, are very little use when emptied. Drums are returnable.

Anti-Dazzle.

THE motor cycling organisations must watch Sir Eric Geddes very closely. If the dailies are reliable, he is even now on the verge of forbidding left-hand steering for cars, after winking at the importation of thousands so equipped, whilst their safety is equal to that of a Rolls on French roads. A Ministry which is capable of such intentions is not to be trusted overmuch where motor-cycle lighting is concerned. I have just received delivery of a 'bus with electric lighting, and it is fitted with an anti-dazzle device, which I happen to know has been turned down as inefficient by the powers that be. I have tried it on a dark night, and the light it affords is absolutely dangerous under tricky conditions. It is barely adequate for very slow work over very good roads. At legal limit in twisty lanes it is homicidal and suicidal. If we are tied down, as seems possible, to a still pronounced dimming of our head lamps, there will be a fine crop of accidents. Glaring head lamps are an admitted evil, and nobody will be better pleased than motorists if some non-dazzling lamp can be devised which affords the necessary minimum of illumination. But whereas glare is merely an inconvenience, over-dimming is a public danger. The suggested new Bill includes the absurd proposal to limit motor cycles to a head light less than one head lamp of a car. Put four wheels on a motor cycle (and pay the extra tax), and one will be able to have more than double the light.

Car Type Tyre Valve.

MR. BROOKER, of Prices's, follows up my paragraph on car type tyre valves by denouncing the tiny circular rubber washers which all tyre makers fit inside the small helmet caps over their valves. We all know that they are apt to leak, and he considers that they crumble, and that rubber crumbs from this source are to blame for most of the leaks which occur at the pear-headed pin. His lodge is to cut plugs from a leather strap with a chemist's cork-cutter. He seccotines the top of such a plug to make it stick in the metal cap, and he castor oils the lower side to keep it supple. Having done this, he does not expect any valve leakage for months and months and months. So that's that. What have the tyre makers got to say about it?

Good for Sunbeams!

A PAL picked up a stray copy of *The Motor Cycle*, studied it with his usual concentrated interest for a few minutes, and suddenly began to wave it round his head. He had reached the announcement of a 1921 3½ h.p. solo Sunbeam, weighing 50 lb. less than this year's model. I thoroughly agree with him that the Wolverhampton departure is a splendid policy. All *The Motor Cycle* men who reported the last Six Days agree that the present A.C.U. policy tends to develop a machine which is unnecessarily cumbrous for ordinary riding. Over and above that, the natural tendency of designers to produce their 500 c.c. machines with an eye to lugging a sidecar has already spoilt several once delightful machines for solo work. We badly need a few more first-class touring mounts designed for solo work pure and simple, and for solo work on roads which are not more than normally rough or difficult.

My Winter Mount.

FOR a long while past I have regularly bought a baby two-stroke in the autumn. During the winter one doesn't want to go fast (too cold); one doesn't want to make an expensive machine look shabby (too much depreciation); one doesn't want to handle 3 cwt. of metal (too many clothes on); so a baby always seems indicated by November at latest. The drawback usually is that there hasn't been a suitable illuminant. Dissolved acetylene, formerly the goods for short-distance nightwork with many stops, is too bulky for a baby, and makes it look like a roller skate with a roll of lino balanced on it. Dry batteries are very nice, but are apt to strand such a casual individual as myself. This year I am expecting a pukka, bijou dynamo set for use on my baby, and I feel very cosy in mind at the prospect. Still, between ourselves, I will confess that I shall feel still more cheery when the roads begin to dry up in March, and something of a mile-a-minute calibre is delivered. We've had frost, thunderstorms, and drenchers this week; so for the moment I'm not nuts on speedwork

Splitting Two-gallon Cans.

A MERRY fellow in the R.N. has sent me a witty screed on the problem of replenishing a 1½ gallon tank at a surly garage which won't split cans. His own method is to be quite cheerful about the villainy, and say, "Very well, but don't imagine I shall leave the odd half-gallon for you; I shall pour it on the road!" This simple bluff often succeeds. The notion of such waste usually scandalises the proprietor, who suddenly remembers that he has a taxi at hand, which can do with the surplus juice. On the other hand my hon. and gallant friend has no use for petrol standpipe installations. He considers that they run anglers and Ananias very close indeed. I must watch them. Personally, having a childlike mind, which loves to see how things work, I am generally so fascinated by the fellow who turns the handle and the thingamajigs that creep up and down that I forget to verify the measure. I presume that, as petrol prices creep up and up, we shall all insist on having tank gauges, and grow very canny about full measure.

Ships of the desert in the original and the modern form. One of the most remarkable demonstrations of the trustworthiness of modern motor cycles was made during the war by the B.S.A.'s in German East Africa. Many of these machines are still in service in Egypt.

A TOUR OF THE CORNISH COAST.

Exploring Little-known Coves and Villages on a Motor Cycle.

WITH a fervent desire for fine weather, I recently started from Exeter for a leisurely tour round the Cornish coast. I determined to poke myself and the bicycle into all the little spots which were to be found, and which are not on the beaten track of tourists.

Proceeding *via* Okehampton and Launceston, I found my way to the "wind hollowed heights and gusty bays of sheer Tintagel." From Exeter to about five miles west of Okehampton the road is very poor, but from there till the narrow byways leading down to Tintagel are reached the surface is fine.

Those who have never been to Cornwall cannot realise the rugged grandeur of its coast. They have yet to see the little fishing villages tucked in between the grim cliffs and the ever-changing colours of the great Atlantic—now green, now blue, now turning almost to purple. At Tintagel, the ruins of King Arthur's Castle on the rocky headland are filled with dreams for the dreamer, and even the simple tourist tripper must acknowledge their magnificence. On leaving Tintagel, the next place to visit is Port Isaac, well away from the beaten track and all alone in its sleepiness. The roads leading from the village are rough and steep, but it is a typical Cornish fishing village and worth the damage to the tyres.

The Unattractiveness of a "Resort."

After finding the way to Wadebridge *via* St. Endellion and St. Minver, a very fair road was followed to Padstow, a pretty enough spot, but too busy and wide awake to be really Cornish. From Padstow, one can either go along the lanes to Newquay or else return to the main road and continue *via* St. Columb; the lanes I tried and found very rough and came to the conclusion that they were not worth while.

Now comes the dull portion. Newquay I found too much of a "town complete with hotels and visitors" to be really interesting, so I decided to get on to Penzance. Following the main road *via* Summercourt, Redruth, Camborne, and Hayle, it is hard to lose one's way. The surface is good with the exception of the Redruth and Camborne sections, where one encounters tramlines.

Off the Beaten Track.

Penzance being a convenient place for further excursions, it is as well to stay there for a day or two. Of course, the best trip is to go to Land's End and then follow the coast as near as possible to St. Ives and return *via* Hayle to Penzance. On the way to Land's End, I turned off *via* St. Buryan to visit the famous "Logan Rock." The route to the rock takes in Penberth Hill, which, with its hairpin bend, would be useful in any trial. One meets many nasty steep pitches if you poke round off the beaten tracks, and so it is just as well to have a look at the brakes before you come across one of these. The road surface in the whole peninsula might be a great deal

A Tour of the Cornish Coast.—

worse, although the road from Penzance to Land's End is poor, and, on the north side especially, its windings resemble a dog chasing his own tail!

It is not for me to attempt to describe the scenery at Land's End and on the way to St. Ives—the sheer cliffs and the ragged rocks with the great expanse of multi-tinted ocean. The whole of the Cornish coast is the "Mecca" of artists, and St. Ives, with its quaint narrow streets, is better left to the brush than to the pen.

The following day was spent in wandering along the coast to Lamorna Cove, and the so-called roads I went over were easily the worst I found in Cornwall. From Penzance to Newlyn you bump and bounce, and you continue to bounce and also twist to Mousehole. Then you climb one side of a precipice and fall down the other into Lamorna. At first you think the lane is going to "peter" out to nothing, but, if you persevere, you do eventually come out in the cove.

Some Cornish Characteristics.

Newlyn is another home for artists, but, unfortunately, it has a high smell of fish, which spoils its beauty. Mousehole (the name first attracted me) is an odd little spot—all ups and downs, but very Cornish.

From Lamorna Cove, the better road back to Penzance is to go up the valley to Paul and thence to Newlyn, but one should beware of Paul Hill On the day I rode down it, it was recovering from a heavy storm of rain, and the slimy state of the surface put me once into the hedge and almost turned me round several times; I did not like it at all and had the "wind up" badly!

Having exhausted the district round Penzance, the next to explore is the Lizard. On the way I stopped at Marazion and took a boat across to St. Michael's Mount—another place for the dreamer. When the family is in residence, one is not shown over much of the old sea castle, but no one could go to Cornwall and then not visit St. Michael's Mount; the old guide alone is worth the visit with his reminiscences always prefaced by "When I was a lud."

Mullion Cove seemed as good a place as any to stay, so I put up there for a couple of nights. The road is quite good as far as Helston, but from there to the Lizard it gets gradually worse; there are no hills to speak about on the main road, however.

The rest of the day I spent wandering on foot round Mullion and Poldhu, and then early the following day I set out on a voyage of discovery round the rest of the Lizard Peninsula. The first place was Cadgwith, and it was the prettiest village that I found in Cornwall. In a quiet little village like this, one felt very much the unwelcome tripper; you felt almost ashamed to bring a modern and somewhat noisy piece of machinery to disturb its peace and beauty. As the "padre" passed my Triumph, I heard him mutter, "Another of those beastly things." Perhaps I should have agreed with him had I not moved with the times—as he had not.

After leaving Cadgwith, I went on to the Lizard and found I could see over the lighthouse after 1 p.m. Like all lighthouses, it is spotlessly clean, and to anyone interested in engines, it is well worth the visit

Kynance Cove was the next stop. I tried to get down to the cove on the motor cycle, but I had to give it up and walk. This is another famous beauty spot; with its white sands and great isolated rocks its equal could scarcely be found in the British Isles.

A Good Main Road Run.

As the weather looked like breaking, I decided to return next day to Exeter. I stopped for a short time at Truro to have a look at the new cathedral, which was only completed recently, and then run straight through to Exeter *via* Bodmin, Liskeard, Callington, Tavistock, and Moretonhampstead. The run of 124 miles was done in a riding time of a little under four hours and on just a gallon and a pint of petrol, with not one change from top gear all the way.

The road back is good till one gets into Devon, then it deteriorates from Two Bridges to Exeter.

It was a great tour—perfect weather, perfect scenery, decent roads, and no crush. If anyone wants to tour now or early next year, let him try Devon and Cornwall, and I only hope he will enjoy it as much as I did.

ROY S. HARTREE.

Despite the dampness of the summer, the hedgerows are laden with blackberries ripened by the autumn sun; a sidecar is the ideal means of reaching the untouched profusion of the countryside.

NOTES FOR THE NOVICE.—VI.

VARIABLE GEARS—3.

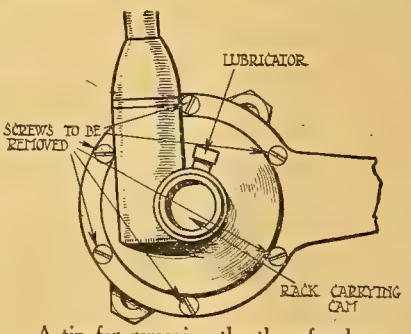
(Continued from page 412.)

The Care of Gears.

A GEAR box being without means of adjustment requires only lubrication and occasional washing out with paraffin. With regard to the former the makers' advice should be followed, but, generally speaking, a thick oil is the best lubricant; engine oil will answer the purpose very well. This is better than grease, which may set a little too stiff, when the pinions will plough grooves and cease to obtain adequate lubrication.

Many gear boxes have to be shifted along slots for the purpose of chain adjustment. When this is the case it should be impossible to set the gear box out of line, but there is often a little play, and it is advisable to take great care to see that the chain alignment is correct. Moreover, it is quite possible that the chain adjustment may be altered slightly by the action of screwing the gear box tightly into position, therefore this should always be checked again when all is secure.

I have said that gear boxes do not permit of adjustment, but this does not apply to the Enfield gear, which is not a gear box. In this gear expanding rings operated by pegs grip the high or low gear sprocket as required. These pegs are in turn forced outwards by a three-faced sliding cam; these faces are numbered 1, 2, and 3. When the machine is sent out No. 1 will be in position. When wear takes place and cam No. 1 will no longer press the pegs far enough to cause the expanding bands to grip the sprockets with sufficient force (but this should not occur until many thousands of miles have been covered), it will be necessary to bring cam No. 2 into engagement. To do this proceed as follows: Take off the nut which covers the end of the cam rack, remove the six small screws holding the pinion container, and turn the gear lever into the low gear position and beyond. This should withdraw the cam so far that it may be pulled out with the fingers. If this is still impossible, put some small objects such as nuts behind the edge of the pinion container on each side and again move the lever. The cam must now be replaced so that the next face comes in contact with the pegs. Each cam is five thousandths of an inch higher than the preceding one. Do not try to force the cam into place with the gear lever until the small screws are tightened up. Occasional lubrication with engine oil will keep this gear in excellent order for a very long time. If it is inclined to stick, wash it out well with paraffin, having first removed the chain case so that the paraffin may be poured between the sprockets.



A tip for removing the three-faced cam in the Enfield gear by means of the gear lever and nuts placed behind the flange.

Changing Gear.

Generally speaking, the gear should not be changed until the clutch is released, and on some machines the gear box is so arranged that it cannot be done, for the gear lever is locked till the clutch lever is moved. This is common American practice. On the other hand, it is often quite easy to change on the exhaust lifter; this is more suitable to a change up than a change down, as it cuts out the engine for a moment and allows it to slacken speed. A change down can, if well timed, be made by the gear lever alone, as if correctly done the engine will quicken up and drop nicely into the lower gear at its new speed. Novices are, however, always advised to adhere to the instructions of the maker, and these are usually to change on the clutch. An exception is the B.S.A., where a change up on the exhaust is recommended, and a direct change down without touching any other lever.

It is not very easy to change from top to bottom direct on the A.B.C. unless going slowly, as the engine, under other circumstances, must be speeded up considerably, owing to the large difference between the top and bottom ratios, which causes the pinions to be engaged, to be revolving at very different speeds. Double clutching may well be employed in this case.

The Enfield and other gears of the same class are very easy to use, as they are engaged by friction clutches, and nothing but the gear lever need be touched, though there is no objection to raising the exhaust for a moment when changing up. A change down should be made as quickly as possible when ascending a hill with the throttle fairly well open, as the engine will then quicken up to the required speed in a very short space of time. On the other hand, when travelling at a very slow speed with the throttle only just open, and it is desired to change down for traffic, a slow change is better.

ROAD TESTS OF NEW MODELS

THE 8 h.p. ZENITH ON THE ROAD.

IT is a remarkable tribute to the efficiency of the Gradua gear that it has been continually on the market, with very few modifications, for the last ten or twelve years. The fascination of driving a machine with a gear which is infinitely variable between two points is certainly very great, and if the difficulties usually attending belt drive are overcome it still remains, on account of its smoothness, the most delightful form of transmission.

Our experience of the latest model Zenith tends to show that the designers in this case have eliminated the more serious of their drawbacks, *i.e.*, belt-slip, due to microscopic pulleys, and inability to gear under about 7 to 1. Of course, this improvement was effected by the introduction of the forward countershaft.

Absence of Belt Slip.

The machine was used mainly for business purposes, and on two occasions carried the rider and passenger over a forty-mile cross-country road which contained one or two rather steep hills, to Brooklands, while much of the journey was over narrow winding lanes with bad surfaces. Previously the rider had found it difficult to cover the forty miles in less than two hours, but with the Zenith on a certain night, when it poured with rain, and in consequence very few people were about, the time taken to accomplish the journey was very considerably shortened. People will at once imagine that with a machine fitted with belt drive the belt would slip seriously under these conditions, as the roads were literally swimming with water, but we are glad to say that this was not so, even though the belt was put on new that afternoon, and the initial stretch had not been taken out of it. Needless to say the belt did require adjusting the following morning, but the fact remains that it held perfectly through the torrential rain encountered on that drive.

A Semi-automatic Carburetter.

The J.A.P engine fitted to this particular machine was remarkably smooth, being beautifully balanced, reasonably flexible, and giving ample power. The carburetter was a 1920 Amac, which provided delightful flexibility from about fifteen miles an hour to the maximum speed of which the machine was capable, but as it was adjusted, at small throttle openings the firing was apt to be erratic and the mixture extremely difficult to find, which proved to be rather troublesome in traffic. In the open country, on the other hand, the air could be placed fully open and the carburetter was then practically automatic in action.

Saddle Suspension.

The machine was exceedingly comfortable, and this was very largely due to the patent system of saddle springing which is the invention of Mr. F. W. Barnes. The saddle is suspended on quarter-elliptic leaf springs, and is hinged at the rear so that the top can be inverted in case of wet weather, thus keeping the seat dry for the rider. The system efficiently absorbs all road shocks, and with it a broken spring should be impossible. The spring forks are also most comfortable. As a great deal of our riding was done over rough roads we are well qualified to speak of the excellence of these fitments.

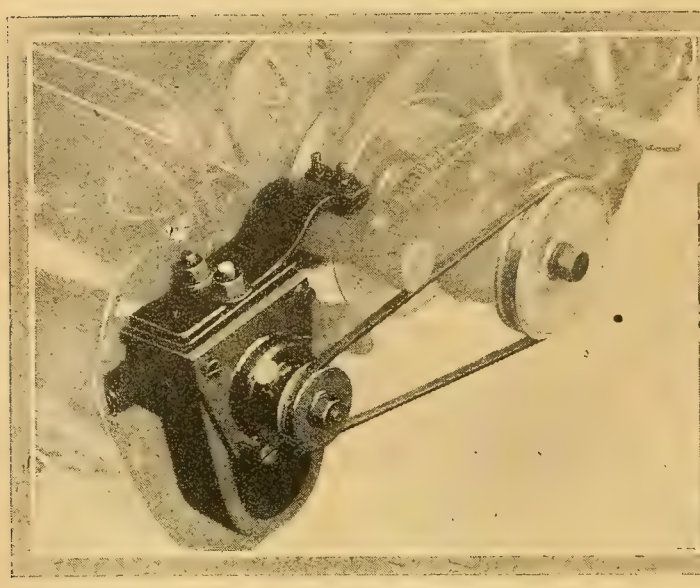
The Zenith Big Twin has undoubtedly advantages over many of the heavier machines of equal horse power which are now upon the market; it is obviously lighter on account of the absence of a heavy gear box, with the result that the speed and acceleration are all that can be desired. During the two or three hundred miles we drove the machine we were certainly delighted with it, and also with the sidecar (a Millford) which was comfortable and well sprung.

EXPERIMENTS IN ROAD MAKING.

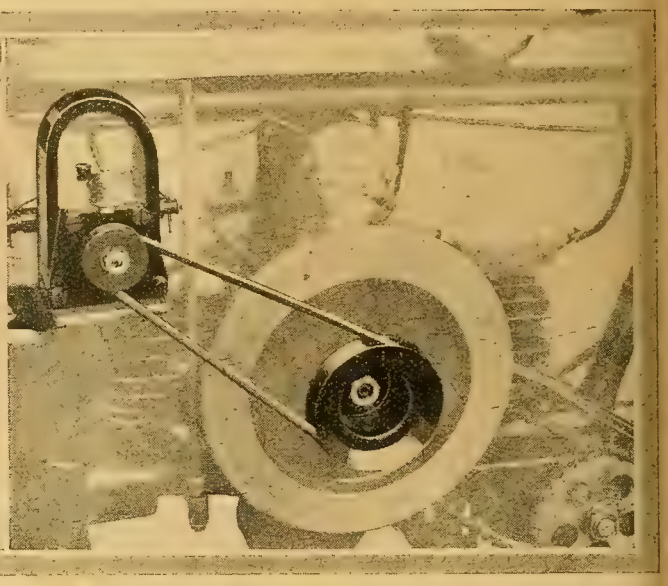
ON tour recently in the West of England we traversed several sections of newly made road with which the Somerset County Surveyor is experimenting. The public are invited to watch the progress of these experiments as, alongside each section, there are signboards giving particulars of the construction. This step, though not new, is in the right direction as, in a few months time, the surveyor—and the public—will be able to judge which form of construction is the best for main road traffic, as any vehicle passing along the particular road will traverse the whole of the experimental sections.

A PERMANENT MAGNET DYNAMO.

An Easily-fitted Lighting Set for Solo or Sidecar Machines.



The Astra dynamo fitted to an 8 h.p. Zenith. Observe that the pulley is bolted on to the engine shaft, and the dynamo carried in an inverted position, protected by the magneto mud-flap.



An entirely different position is utilised when fitted to a Douglas. The dynamo is carried on a special bracket attached to the down tube.

MOTOR cyclists have long been on the look-out for a dynamo lighting installation which can easily be fitted to a motor cycle and is not too heavy or cumbersome to be adapted to a solo mount. The Astra dynamo appears to fulfil these requirements exactly.

The dynamo consists of a die cast carcase supporting two tungsten steel magnets, and between their pole shoes a laminated armature with commutator and windings rotates on Hoffmann ball bearings.

The output of the dynamo is governed by armature reaction. As the armature, when rotating, develops a reverse field in opposition to that of the permanent magnets, and as the reverse field increases with the speed of rotation, a point is arrived at when the armature field equals that of the field magnets and so prevents the voltage and current rising to too great an amount. The Astra dynamo is thus self-regulated, and there is no danger either of over-charging or of charging the accumulators too rapidly. To obviate the necessity of a cut-out, the windings are so arranged that the voltage of the battery can only flow through the armature at a steady speed; and although it is desirable that the switch is "off" when the engine is at rest for any appreciable time, the discharge is slight and cannot cause any damage beyond slowly discharging the accumulator.

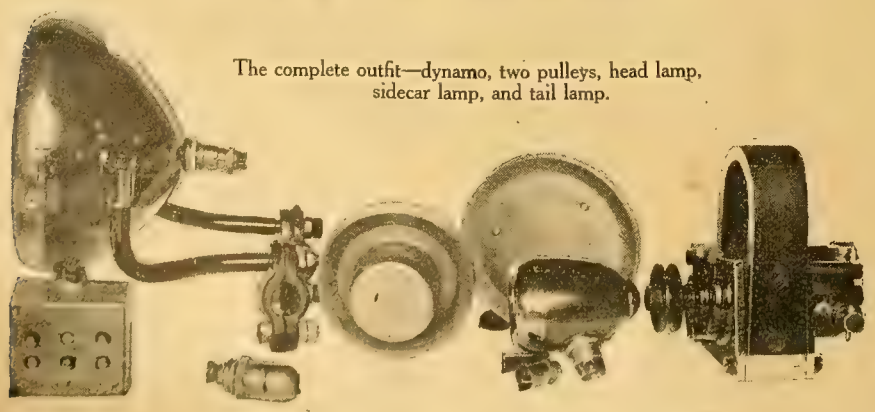
Simplicity of Construction and Operation.

The D.C.1 pattern machine, which is adapted to motor bicycles and sidecar outfits, has a pressure of 4 volts, and generates from two to four ampères when working at normal speed. Thus, its capacity is sufficient to light three lamps of useful size.

The wiring is extremely simple, and provision is made for the insertion of an automatic cut-out and ammeter if desired. These are hardly necessary, but may find a place on a sidecar outfit *de luxe*.

The dynamo may be run in any position, or in either direction, but if it is run in the reverse direction to that indicated by the arrow the colour of the terminals should be changed; as in this case negative becomes positive and positive negative. The dynamo charges at very low engine speeds, and needs very little attention as regards oiling, only one drop every few hundred miles being necessary. The complete outfit consists of a handsome head lamp, an exceedingly neat tail lamp, which also illuminates the number plate, and when sidecar outfits are equipped with the installation, a small but handsome sidecar lamp. The switchboard is fitted to the top tube, and controls the dynamo and also the lamps fitted. Suitable pulleys are supplied for various makes of motor cycles.

The Astra dynamo was formerly known as the M.I.R.A., but is now manufactured in this country by the Astra Dynamo Co., 110, Victoria Street, London, S.W.1.



The complete outfit—dynamo, two pulleys, head lamp, sidecar lamp, and tail lamp.

COMPULSORY ROAD SIGNALS.

AT last there appears to be some hope of compulsory traffic signals being demanded of all vehicle drivers, for a committee is now sitting to advise the Minister of Transport on this important matter.

Up to the present it appears that only two signals may be definitely anticipated as compulsory—one indicating "Stop!" by a vertical uplifting of the hand, the other showing that a right turn is to be made by an outward extension of the arm. Two other useful signals are recommended and illustrated in *The Autocar* this week.

SOME UP-TO-DATE OVERALLS.

SOME time ago our contributor "Ixion" expressed a desire for overalls which could be fastened quickly and surely, and at the same time could be put on and taken off without soiling the interiors, and eventually the rider's trousers. And we think he spoke for the majority of motor cyclists.

We have received from Messrs. E. B. Hamel and Sons, Tamworth, two most excellent leg overalls, which fully meet these requirements. Their chief feature is the method of fastening by a patent seam made by Kynoch, Ltd.; Witton, Birmingham. It consists of two rows of tiny metal steps which may be pulled together by a special clip; and so firmly are they interlaced that it would actually require a pressure of 250 lb. to separate them. A single tug at the clip end, however, and they "rip" apart again as easily as tearing tissue paper. The metal is rustless and apparently indestructible; and the seam, when closed, is hidden from view by a flap.

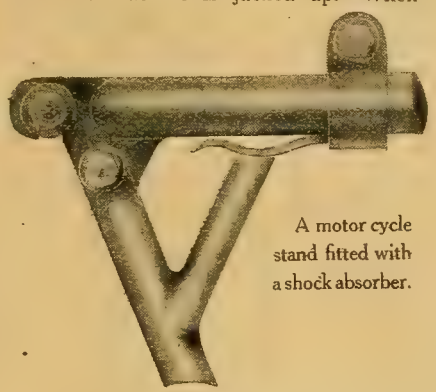
The patent fastener opened from top to bottom of overall.

The overalls themselves are particularly well-made, and are manufactured by the Leyland and Birmingham Rubber Co., Ltd., Kent Works, Maryhill, Glasgow. Of the two pairs sent one has the ordinary short opening, and save for the fastening is merely an example of the usual type of overall; the other pair, on the other hand, are of the type which will cause our friend, "Ixion," to rejoice, since the opening extends from the bottom of the leg to the very top of the garment. Our illustration shows clearly how easy it is to withdraw the soiled boot without even touching the interior of the overalls. They are certainly the most practical garment of their type we have ever seen on the market, and, in our opinion, their success is assured.

Showing how the overalls may instantly be removed without soiling their interior.

A STAND IMPROVEMENT.

A MOTOR cycle stand shock absorber has been invented by Mr. C. J. H. Stevens, 21, Priolo Road, Charlton, London, S.E.7. The clamp piece together with its spring is fitted on to the chain stays, and is adjusted in position so that it meets the prong of the stand when the machine is jacked up. When the correct position has been found the clamp is tightened. The steel spring is made to slide along the chain stays and consequently takes the brunt of the shock when the machine is brought to rest on the stand.



A motor cycle stand fitted with a shock absorber.

A NEW SIDECAR WINDSCREEN.

A PRACTICAL windscreen, enabling the passenger to have a full view of the road, and at the same time protecting him from the elements, has lately been brought out by Mr. W. Richardson, Dene View, Dipton, Co. Durham. It will be noticed that side wings are provided, which give further protection.

The fittings are exceedingly simple, the screen being merely held by two turn studs, which can be operated by the passenger from the inside. When not in use, the screen may be removed, rolled up, and packed in the bottom of the sidecar.

The Con Top windscreen, a design commendable for its simplicity.

AJUSTOSIZE GAITER.

An adjustable legging.

THIS gaiter is specially designed by the College Leather Co., Castle Street, Northampton, so that it can be attached quickly and yet can be adapted to suit the size of the rider's calf. When once the straps have been adjusted to suit the rider's leg, the gaiter can be fastened by means of the press buttons shown in the illustration. As the gaiter is intended to fasten from behind, there is no danger of wet driving in.

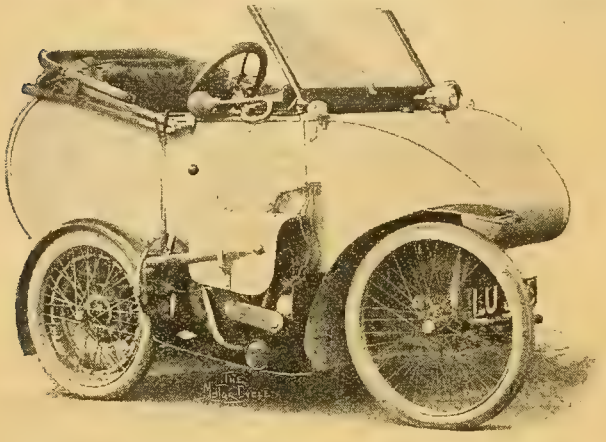
WINTER COMFORT.

Both drivers and passengers of the fair sex will appreciate the motoring helmet illustrated, and which is the registered design of Mr. H. Bednall, a leather specialist, of 55, Sutton Crescent, Walsall. It is made of black leather trimmed in fur, and we anticipate will be much in favour with motor cyclists of both sexes during the coming winter.

A Sociable on Sidecar Lines.

A Three-wheeler neither Sidecar nor Cycle Car.

THE great capabilities of the modern sidecar outfit compared with vehicles costing perhaps a hundred pounds more have caused much thought amongst designers, trade and amateur. Here is one commendable attempt to combine the comfort of the two-seater with the lower production cost and other advantages of the sidecar.



Solving the weather problem. The Austin two-seater sidecar, which has given its owner and designer every satisfaction on the road.

Our issue of August 12th, page 195, contained a description of the patented frame. It is in this case built of ash in the form of a bow girder, the inventor claiming that a steel construction would be much heavier for the same rigidity. The power unit is a 4 h.p. (495 c.c.) V twin J.A.P. carried on two stiff tubular steel bearers, with a Sturmey-Archer three-speed gear box attached to the rear engine plates. Final drive is by belt. By reason of the absence of the usual frame and tank the complete unit may be removed in a few minutes. The front axle is, of course, pivoted, steering being on car lines.

The front wheel, only, is sprung; the steel axle being suspended on an amply proportioned vertical bearing, which should eliminate any jar.

The body, made of sheet steel, is mounted on two semi-elliptic transverse springs, and by inverting the front spring (*i.e.*, ends coupled to the body, and the centre of the frame) side roll is eliminated.

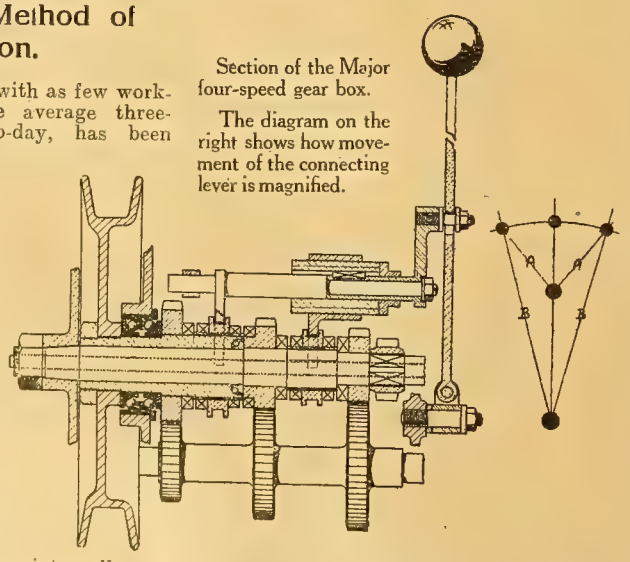
This model has done 3,000 miles, and, it is claimed, averages over 60 m.p.g., attains a speed of over 40 m.p.h., and climbs most hills on top. The designer and builder, Mr. Austin Webb, would be pleased to hear of any firm interested commercially.

A Simple Four-speed Gear Box.

An Unusual Method of Operation.

A FOUR-speed gear, with as few working parts as the average three-speed box of to-day, has been patented by Mr. H. A. Major.

The chief novelty lies in the method of operating the two sliding dog-clutches, one of which moves on a castellated portion of the main shaft, and the other similarly on the loose sleeve carrying the pulley. Bearing in mind that the hand lever works in an ordinary H type gate, the method of sliding the left dog clutch is obvious. But the actuating fork for the right dog is carried on a sleeve which has an internally cut quick operating thread, engaging a similar thread on the horizontal lever. A small back or forward movement of the main lever gives rotation to the horizontal bar, thus in turn giving a longitudinal movement to the right actuating fork.



Section of the Major four-speed gear box.

The diagram on the right shows how movement of the connecting lever is magnified.

How the gears are obtained is best illustrated by following the movements of the hand lever in an imaginary gate. It is now in neutral. Pull it to the left, and the left hand dog clutch immediately engages the pinion on its left. Continuing the motion forward the right hand dog clutch engages on its right, thus giving us the combination for first gear. Now, on a full backward pull, still on the same side, the left hand fork does not move, but the right hand dog clutch moves right over to its left engaging the centre pinion, which gives us second gear. It will be readily understood now that with the main lever on the right hand side of the gate, and thus the left dog clutch engaging the middle pinion, there are two further combinations possible which give third and top gears. The latter is direct: both dog clutches engage the central pinion, thus locking solid the main shaft and pulley sleeve.

WEST MIDLAND OPEN TRIAL RESULTS.

B.S.A. CHALLENGE CUP AND GOLD MEDAL (for best performance of the day).—Frank W. Giles (6 A.J.S. sc.).

TERRY CHALLENGE CUP AND GOLD MEDAL.—L. L. Sealey (3½ B.S.A.).

WOLVERHAMPTON MOTOR SERVICES CHALLENGE SHIELD AND GOLD MEDAL.—Reg Brown (3½ Sunbeam sc.).

SILVER CUP (for second best performance in solo class).—B. L. Bird (2¾ Marloe-Blackburne).

SILVER CUP (for second best performance in sidecar class).—W. E. Smith (8 Enfield sc.).

SILVER CUP (for best performance in single gear class).—J. G. Nickson (3½ Aero).

SPECIAL GOLD MEDAL PRESENTED BY A.J.S., LTD.—B. L. Bird (2¾ Marloe-Blackburne).

Special Prizes for Members of the Organising Clubs.

REDDITCH AND DISTRICT M.C.C.—Gold medal for best performance and silver medal for second best performance in each of the following classes: Up to 500 c.c. solo.—1, A. E. Wood (3½ B.S.A.); 2, H. Poole (3½ B.S.A.). Up to 600 c.c. solo: 1, L. L. Sealey (4¼ B.S.A.); 2, E. Roper (4¼ B.S.A.). Sidecars (unlimited).—1, W. E. Smith (8 Enfield sc.); 2, F. Bicknell (8 Enfield sc.). Special prize for best performance by an amateur.—A. L. Norton (3½ B.S.A.). Gold medal, presented by the Enfield Cycle Co., Ltd. (for the best performance in any class).—L. L. Sealey (4¼ B.S.A.).

WOLVERHAMPTON AND DISTRICT M.C.C. (gold medals for best performances in each of the following classes): Up to 350 c.c. solo.—F. J. Price (2¾ Diamond). Over 350 c.c. solo.—C. Williams (4 Norton). Sidecars (unlimited).—F. W. Giles (6 A.J.S.).

KIDDERMINSTER AND DISTRICT M.C.C.: The Castle Challenge Cup (for the best performance in any class).—F. W. Giles (6 A.J.S. sc.). Gold Medal for Best Solo.—R. Fellowes (4 Triumph). Silver Medal (for Second Best).—W. S. MacFarlane (4 Arab-Blackburne). Silver (for Second Best in Sidecar Class).—G. H. Ratcliffe (4 Triumph sc.).

TEAM PRIZE (three gold medals): Norton team.—L. Paynter (3½ Norton), H. W. Hassall (3½ Norton), and T. F. Watson (4 Norton sc.).

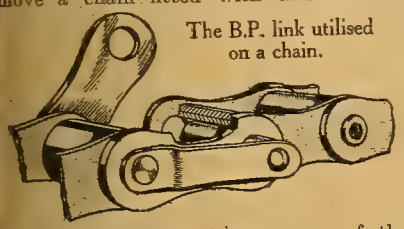
GOLD MEDALS.—J. C. Walker (2½ Edmund-Jap), W. Swiffen (4 Verus), F. W. Giles (5-6 A.J.S. sc.), H. Boynton (6 James sc.), B. Bladder (8 New Imperial sc.), B. L. Bird (2¾ Marloe-Blackburne), Eric Williams (6 A.J.S. sc.), H. Langman (3¾ Scott), L. L. Sealey (4¼ B.S.A.), L. Paynter (3½ Norton), H. W. Hassal (3½ Norton), W. E. Smith (6 Royal Enfield sc.), C. Wilson (3½ Norton), H. B. Denley (10 Morgan), S. Hall (2½ O.K. Junior), W. Handley (2½ O.K. Junior), S. H. Rhodes (2¾ Wolf-Blackburne), E. A. Roper (1¼ B.S.A.), Reg. Brown (3½ Sunbeam sc.), R. B. Clark (2¾ Coulson B), A. Wood (3½ B.S.A.), G. Denley (2¼ Velocette), B. Kershaw (2¾ Verus), and R. W. Duke (4 Triumph).

SILVER MEDALS.—A. Farr (3½ B.S.A. sc.), T. F. Watson (4 Norton sc.), J. Walker (2¾ Marloe-Blackburne), J. M. Philpott (2¾ Wilkin), F. J. Price (2½ Diamond), H. L. Willis (3½ Norton), F. Bicknell (6 Royal Enfield sc.), H. Poole (3½ B.S.A.), J. Dosher (6 Royal Enfield sc.), R. T. Cooke (4 Triumph), R. Cooper (2½ Alldays Allon), L. E. Clulee (2½ Alldays Allon), H. Moule (5-6 Rover sc.), Alec Wilkes (3½ Rover), G. H. Ratcliffe (4 Triumph sc.), R. Fellowes (4 Triumph), A. W. Taylor (4¼ B.S.A.), W. J. Edwards (2¾ Omega), A. MacFarlane (4 Arab-Blackburne), W. Whitehouse (3 A.B.C.), and B. Ivens (——).

BRONZE MEDALS.—J. A. Newman (3½ Sunbeam sc.), F. Arbuckle (4½ Humber), R. O. Bennett (2¾ Federation), T. B. Haddocks (6 A.J.S. sc.), V. Collins (4¼ B.S.A.), W. A. Carr (8 Morgan), Cyril Williams (3½ Norton), J. Wainwright (8 Matchless sc.), D. S. Heather (4¼ B.S.A. sc.), H. Ward (4¼ B.S.A.), G. Dance (3½ Sunbeam sc.), P. Newman (3 Ivy), J. Dudley (3½ Sunbeam sc.), W. J. Chambers (3½ B.S.A.), H. E. Ashley (6 L.M.C. sc.), and A. R. Penmay (2¾ A.J.S.

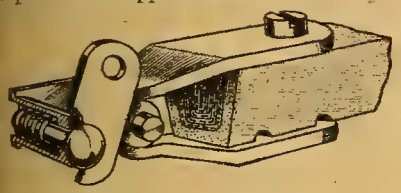
A NEW BELT OR CHAIN FASTENING.

A FASTENING for chain or belt is the subject of a patent granted to Messrs. Brayshay and Paterson, of 24, Queengate, Seagate, Dundee. To remove a chain fitted with this fastener



The B.P. link utilised on a chain.

it is only necessary to press one of the pins inwards, when the link may be swung round, as shown in one of the illustrations. A flat spring keeps the pin in position. Applied as a belt fastener,



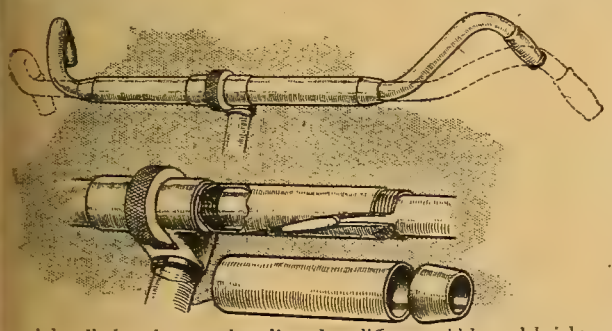
The B.P. link as a belt fastener.

the pin and link are held in place by a coil spring, and in the same way may be pulled out and pivoted round, thus freeing the other half of the fastener.

A NOVELTY IN HANDLE-BARS.

NEW accessories of every type continue to flood the market, but it is seldom that we are shown such an article as an instantly adjustable handle-bar. A fitting of this description has, however, recently been produced by Mr. Murray, of Union Street, Coventry, with the idea of providing a change of riding position while on tour without even dismounting from the saddle.

The construction of the bar will be evident from our illustration, and it is sufficient to point out that by rotating the central milled nut the bars can be made wider by a matter of 6in. and at the same time dropped to a very considerable extent. Any variation between narrow touring bars and wide racing bars can be obtained, though, of course, the length or reach is not materially altered. The construction is strong, and is well carried out.

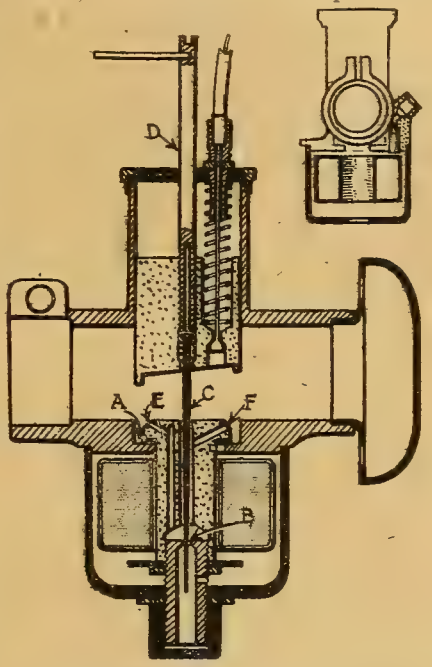


A handle-bar that may be adjusted to different widths and heights by simply revolving a milled nut.

A SIMPLE ONE-LEVER CARBURETTER.

SOME months ago we had the opportunity of trying a Mills single-lever carburetter on a 4 h.p. Douglas and sidecar, which is the property of the designer, Mr. F. A. Mills, the Manor House, Frensham, Surrey. The carburetter is of simple construction, consisting merely of a barrel throttle, to which is attached a taper needle, increasing the supply of petrol as the throttle is opened. In actual practice the carburetter worked extremely well, but since we had the opportunity of trying it it has undergone several improvements.

To start the engine the carburetter is flooded, and a small well of petrol is



A sectional drawing of the Mills carburetter; the letters are referred to in the text. (Inset) The annular float and needle valve.

filled at A. Opening and closing the throttle also enlarges or reduces the jet orifice B by means of a tapered needle C. A screw attached to the needle is provided with a bar so that it may be turned easily, and also has a quick thread of ¼in. pitch for the purpose of adjusting the petrol supply.

The carburetter adjusts itself to different speeds in the following manner: As the revolutions of the engine increase, the suction on the outlet jet E¹ is increased, but, owing to air offering less resistance than petrol, air is drawn down the orifice F, thus supplying a gradually weakening mixture as the engine speeds up, which effect becomes less the wider the throttle is opened, so giving a slightly richer compensation at larger throttle openings. The carburetter gives the maximum of power when the throttle assumes a position settled by experiment, and a stop is provided to prevent it being further opened.

The petrol level has no influence on the working of the carburetter, so long as it is above the lowest portion and below the highest part of the tube or passage connecting the primary jet B with the secondary jet A.

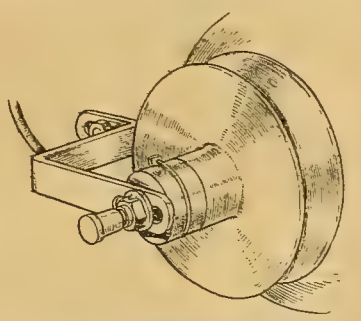
The inventor informs us that he can get eighty miles to the gallon with his 4 h.p. Douglas sidecar, but he does not recommend so attenuated a mixture to be used; he regards sixty miles to the gallon as satisfactory.

The inventor is desirous of getting into touch with any manufacturer interested in the design.

THE COLBRO VARIABLE PULLEY.

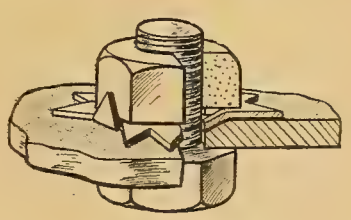
DESPITE its crudity the hand or foot-controlled variable pulley remains the simplest form of change speed gear extant; and, for the many old direct belt driven machines on the road, this advantage probably outweighs its faults.

The Colbro was marketed before the war by Messrs. Collett Bros., 1, Railway Buildings, South Norwood, London,



A handle-bar-controlled variable pulley, adaptable to most old fixed-gear machines.

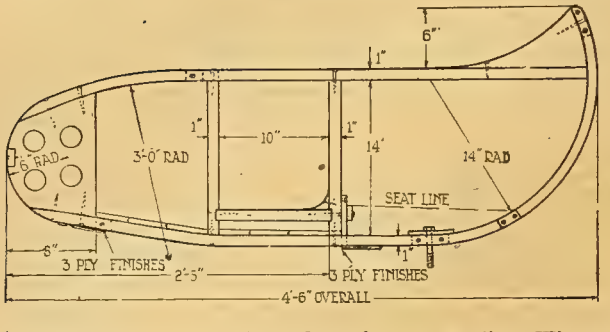
S.E.25, who have now resumed production, and it is an example of this type in its simplest form. Briefly, the outside floating flange is moved laterally by a collar internally engaging with a worm on the pulley shaft. This movement, controlled from the handle-bar, is claimed to give ratios of 4 to 8 to 1; and by allowing the belt to "bottom" on a slip ring a free-engine position is also obtained.

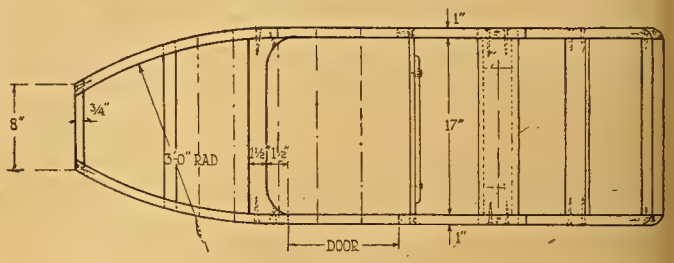


A new locking washer patented by A. E. Bourne, 179, Alexander Road, Acock's Green, Birmingham.

MAKING A SIDECAR BODY.

A Home-made Sidecar. How it was Made, and What it Cost.





Figs. 1 and 2.—Working drawings for the sidecar body.

BEING in need of a light and comfortable sidecar body, and having vainly searched through advertisements and catalogues for one which would be suitable both as regards shape and price, I determined to build one myself, and the result was very gratifying considering that the total cost, including upholstering, amounted (in post-war days) to just over £4.

A Simple Framework.

For the benefit of the many motor cyclists in the same position as myself, and who have a fair idea of wood-working tools, my method of procedure is described below, and, if followed out, should result in a neat and satisfactory job.

The frame consists mainly of 1in. square section ash (or any suitable wood) with a three-ply wood covering, the joints of which are finished with a small wooden bead. Referring to the sectional side elevation (fig. 1), the inner shape and curves of the side members should be set out on a wooden floor and small rough blocks 1in. thick secured at intervals of about 1 foot along the curves, thus forming a jig on which to bend the 1in. square ash.

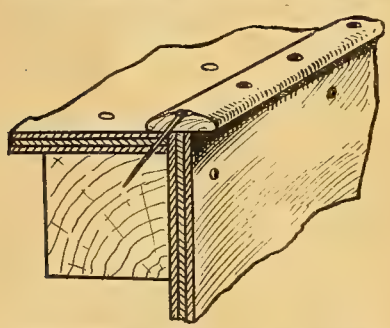


Fig. 3.—Method of finishing the covering.

Assembling.

While these pieces are being steamed or soaked, the two "formers" for the nose can be made from 1in. deal, and to these the side members should be fixed with 2½in. screws preparatory to bending the shape on the jig.

The whole should be framed up complete with all stiffeners and the side bracket pieces above the top member, as shown. It should then be covered with three-ply wood, securely glued and bradded in position before removing from the jig. When completed, the two sides should be joined up with ash cross-members (as shown in fig. 2), starting from the back and working forward, after which the three-ply covering may be fitted as before. Fig. 3 shows a good method of finishing the edges of the covering and fixing the bead.

It should be noted that the front portion of the covering finishes at the front floor support, thus obviating the necessity for handling a large sheet of the covering material during the process of making the curve around the nose.

Fitting the Door.

The floor is necessarily thicker than the rest of the covering and should be made of ¼in. matchboarding, tongued and grooved. This precaution is taken to prevent mud and dirt working up between the joints.

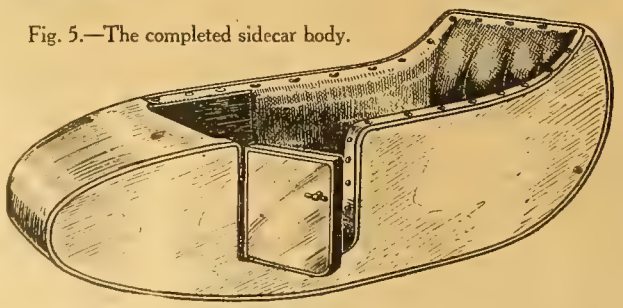
Before cutting the frame for the door the vertical stiffener at the rear of the door should be firmly tied in position by means of the cross-piece supporting the front end of the seat. If carefully cut, the pieces from the frame, together with the three-ply, may be used after framing up, as in fig. 4, for the complete door.

Brass hinges, about 1½in. should be used, and the door hung from the forward edge, so that in the case of its becoming unfastened, it is not blown wide open when the machine is in motion.

The painting may now be undertaken. After rubbing down with glass paper, it is a sound plan to give the whole surface exposed to the weather a coat of gold size, which will effectively keep all damp from the glue in the three-ply wood.

About two coats of lead paint and four coats of the final colour may be applied, and, if well rubbed down with glass paper between each coat, should give a good flat surface.

Fig. 5.—The completed sidecar body.



If it is desired to line the body this should now be done, and to those who are not experts with the brush, an ordinary draughtsman's lining pen and a large French curve are of great assistance.

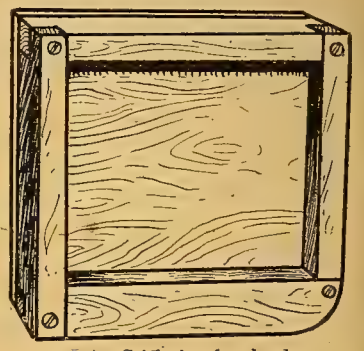


Fig. 4.—Stiffening for the door.

In the case of a wide line, the outside edges should be ruled in with the pen and the intervening space filled in with the aid of an ordinary artist's brush. By this method a first-class line may be obtained although it is a somewhat slow process.

Finishing Touches.

When the whole is quite dry and hard, one coat of good coachmakers' varnish should be sufficient to give a glass-like finish and keep out all wet.

The upholstering is perhaps best left to individual taste. Horse-hair or cocoa-nut fibre forms a very efficient padding, while Rexine (double width) has an excellent appearance, and is easily worked. One yard, if carefully cut, will be sufficient, and when fitted, the edges should be finished off with banding of the same material, held in position by leather-covered studs.

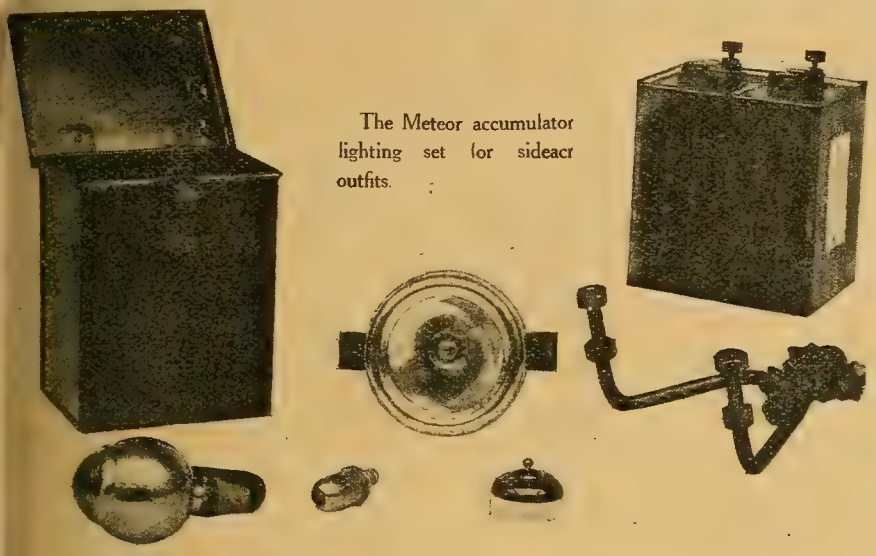
The whole, when completed, presents a most pleasing appearance, as clearly shown in fig. 5. Added to this is the possession of that feeling of satisfaction at "something attempted, something done" which follows completion.

The job is one which should only be tackled by those who have a knowledge of woodwork.

An Accumulator Lighting Set.

A Well-made Example of this Handy and Popular Form of Lighting Installation.

THOSE motor cyclists who have not equipped their machines with lamps must now think of doing so if they are to have unrestricted use of their mounts during the coming winter. The Meteor electric lighting set illustrated will, therefore, be of interest at the present time. It is marketed by the Motor Trading and Garage Co., Meteor House, Summer Row, Birmingham, and consists of a large accumulator in a strong metal case, a medium size head lamp of very substantial construction with a suitable bracket, a small tail light and a switch. When required for a sidecar outfit, a larger accumulator and a ball type side lamp is included.



The Meteor accumulator lighting set for sideacr outfits.

The solo set costs £6 6s., and the sidecar £9 9s.

Practical Experience.

We have one of these sets in use at the present time, and propose at a later date to record our experience of its service on a sidecar machine which is used in all weathers, and with which a great deal of night riding is done. The head lamp gives a splendid light, and so far the set has given no trouble.

Now that accumulators are being designed to withstand a reasonable amount of vibration, this comparatively simple form of electric lighting is becoming deservedly much more popular.

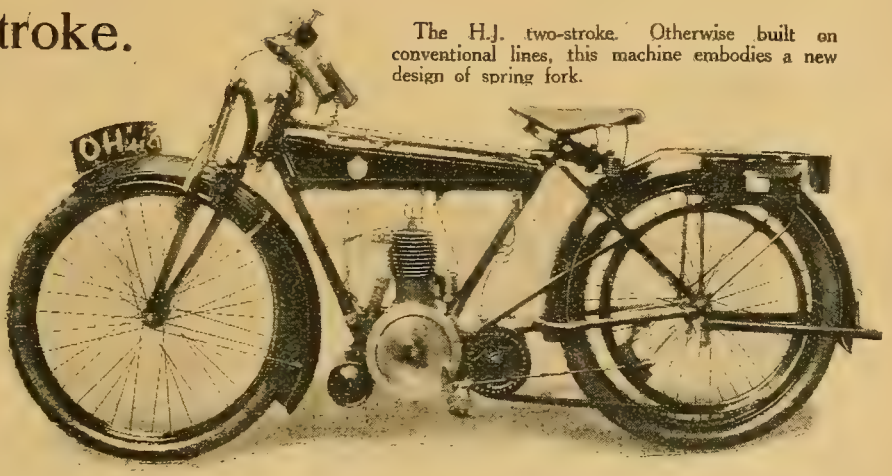
Such a set, of course, depends for its success on regular charging of the batteries, and in many cases, where "continuous" current is supplied, this can be done from the domestic lighting circuits.

The H.J. Two-stroke.

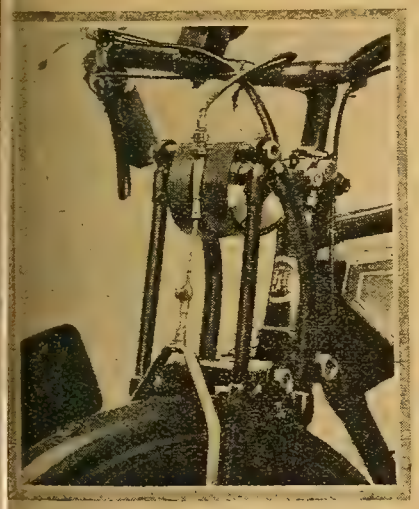
A Popularly Priced Addition to the Lightweight Fold.

ALTHOUGH in the main assembled from well-known component parts, the layout of the H.J. two-stroke shows several instances of careful thought. An extremely neat design of spring fork (pat. 21424) is fitted.

A 70 × 70 mm. Wall engine, Best and Lloyd lubrication, Amac carburetter, Runbaken magneto, and Roc two-speed gear form the specification of the standard model, which sells, with the usual accessories, at £65. A single-geared model, however, is produced at £54.



The H.J. two-stroke. Otherwise built on conventional lines, this machine embodies a new design of spring fork.



The upper portion of the H.J. spring fork showing the action of the leaf springs

Compound Action of Fork Springs.

Reverting to the spring fork, the photograph makes its action almost self-explanatory. Two curved leaf springs replace the usual top links of the Druid pattern fork, and by their design control equally vertical and horizontal movement. Lateral rigidity is maintained by all cross shackle pins being of the floating type and screwed up solidly with the side pieces. The springs are adjustable for load. Howard and Johnson, 19, Hockley Street, Birmingham, are the makers of both the fork and machine.

POLICE PREJUDICE.

DOES this really exist to the extent the following would infer? In some particular districts we are afraid that, perhaps, it does. A correspondent, who was recently mulcted of £17 10s. within a fortnight for two offences in the "driving to the danger of the public" category (which, by the way, he denies), states that he was advised in court by one of the officers to buy a small car, and he should have no further trouble, "for there is a great deal of prejudice against motor cycles and chars-à-bancs." The same correspondent comments on the futility of a system which suspends the licences of well-known expert drivers, and simultaneously grants them to anyone capable of applying.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

COIL OR LEAF SPRINGING?

Sir,—Why is "Ixion" so hard upon coil springs as applied to motor cycles? I know nothing of the theory of the thing, but my experience on a Wooler shows me nothing to complain of. I find that my little 'bus can do 25-30 m.p.h. over surfaces which no rigid frame can cover at more than 15. I have ridden a 1920 spring frame machine using leaf-springs, and would much prefer my own. D. M. O'GORMAN.

ELECTRIC LIGHTING.

Sir,—We ourselves have come across an accumulator which is free from the defects mentioned by your correspondent, *i.e.*, "The Fors" circular type, which has a positive separated from the negative by a porous pot, and, moreover, has rubber sleeves round the lugs and a rubber cushioning base, which absorbs any vibration, and allows of free circulation and freedom from sediment short-circuiting.

We have used this type on cars, sidecar outfits, and solo mounts; and with average care, as regards correct acid, distilled water, and careful charging, it has proved ideal.

The rough roads round this district and neighbourhood have failed to dislodge paste or cause any other trouble after many months' running. EARDLEY GARAGE CO.

Belvedere, Kent.

SANS MAGNETO.

Sir,—I am in agreement with Mr. T. C. Ridings's opinion that an engine continuing to run some few revolutions after the ignition has been cut off cannot be attributed to the Diesel principle.

It is well to note that a Diesel engine starts almost invariably on the first revolution, and from dead cold, the heat being generated by the great compression of the air; and it must be remembered the oil burns and does not explode, and that the compression ranges from 500 lb. per square inch to 900 lb. per square inch, and over in some cases, with a temperature at the period of full compression of 1,000° F.

If these conditions are needed to produce spontaneous combustion, it is unlikely that the engine continues to run from this cause. More likely it is caused by incandescent plug points, or perhaps when the engine is hot (and this has happened with me in the case of large gas engines), there is a badly fitting screw or some pocket that can retain a small particle of flame after the exhaust stroke is completed. At any rate, I see no evidence that the continued running is caused by a reversion to the Diesel principle.

B. HODDINOTT.

MOTORING AND THE PRESS.

Sir,—Now and again one hears complaints of the strange lack of interest shown by the newspapers in regard to things which interest motorists, and especially motor cyclists. Columns are devoted to cricket, football, racing (except motor racing), golf, tennis, billiards, bowling, and skittles—everything except motoring. Brooklands might be non-existent. The "Six Days," though tens of thousands showed their interest in its progress, was almost unnoticed. True, the supposed "slump in the motor trade" is esteemed useful copy. Every day has its paragraphs of motor accidents and the conviction of law breakers for exceeding the speed limit at Little Peddlington. Left-hand drive and the abomination of the char-à-banc emphasise the dangers of the "Juggernaut of the roads." Occasionally half a column is occupied with the opinions (usually ill-informed) of "Our Motoring Correspondent."

One wonders why this should be so. Motoring is the one sport which materially increases production and provides employment. Surely there are as many people who take interest in a great motor trial as in most of the recorded tennis tournaments or golf competitions. Of course, betting at Brooklands is in its infancy, and there are no tipsters to reveal to anxious and expectant sportsmen the secrets of the track.

Stoke Lacy. H. GEORGE MORGAN.

TIMELY AID.

Sir,—I should esteem it a favour if you would grant me space in *The Motor Cycle* to thank Mr. Attwood, the A.C.U. observer, for the assistance he gave me in repairing my broken two-speed gear at Huddersfield in the A.C.U. Six Days Trials. By his skill we were enabled to repair one gear with parts of the other, and so I was able to finish the journey by road instead of rail, though officially retired as per time schedule rule. COMPETITOR NO. 24.

Walthamstow.

LONG EXHAUSTS.

Sir,—May I trespass on a small portion of your interesting and valuable paper in commenting on "Duggie's" letter of the 2nd inst. He infers that long exhaust pipes are an abomination, and stupid, and that machines should be fitted with a large silencer and short tube. Has he considered the various machines manufactured with long exhaust, *e.g.*, Norton, T.T. Rover, Duzmo., etc.? I am sure that no Norton owner would sacrifice his long exhaust for a "jam-pot" and "bit of gas-pipe"! I certainly do admit that nowadays many big towns—particularly seaside towns—are infested by youths who dash about on a noisy little two-stroke with a drain-pipe arrangement in the rear, under the impression that they look "sporty," but they suffer under a delusion, and are more bother than they are worth. A machine properly fitted with a long exhaust should emit a dull deep throbbing sound, and to aid silencing slits may be cut in the last foot length or so of the pipe. F.R.G.

Havant.

M.P.G.

Sir,—Verily "Disabled" must be a stranger to your advertisement pages if he imagines that improvement in consumption ceases at the carburetter, or even at frame design. Whenever any remarkable feat in this line is accomplished, does not every firm concerned, however remotely, lodge its claims in letters large and black?

I call to mind one case in particular, when in a recent trial a rider obtained very high miles per gallon. This excellent result was attributed in turn to almost every accessory on the machine, but I think the palm goes to the makers of his tyres, with their "Why worry about the increase in the price of petrol when you can reduce your consumption by fitting our tyres?" The saving arises, no doubt, from the non-skid properties of the tyres, which eliminate the small percentage of driving wheel slip which always occurs, thereby cutting down the revolutions per mile.

East Sheen H.A.

MYSTERIOUS NOISES.

Sir,—I read with interest "Duffer's" letter regarding a mysterious clinking noise caused by his magneto driving chain. I may say that mine does the same, but rather worse, as it can be heard even when the cover is on. It only occurs when the ignition is two-thirds to fully advanced, and only when the engine is under load. I have tried various methods of stopping it without success.

Gibraltar. ANOTHER DUFFER.

A DISABLED MOTOR CYCLIST'S PREDICAMENT.

Sir,—I hope you will be able to find room in your paper for the following tip, which I trust may be of some use to disabled motor cyclists. A few days ago I had the misfortune to break my exhaust valve on a 3½ h.p. B.S.A. (1912), when three miles from home on a lonely road. As I have lost my right leg I did not know how to get the machine home for a time, but eventually I struck the following idea, which I hope may be useful to others. First I removed the belt and buckled it through the belt of my coat. Then I placed the free end of the loop made by the motor cycle belt over the front number plate, and taking my crutches found that the machine towed easily and steered well.

A B.S.A owner, who, although disabled, pluckily overcame an awkward situation in the manner described in the accompanying letter.

LEWIS R. OLDMEADOW.

THE LIGHTWEIGHT SIDECAR MACHINE.

Sir,—Now that petrol is so dear, and, what is more disappointing, benzole, too, has advanced in price, we are hearing a great deal about the possibilities of low-powered machines, even small two-strokes, as sidecar machines.

The writers of these articles in favour of "flogging the willing horse" seem invariably to overlook the most important item of all, which is the frequence with which these small machines are bound to require renewal of parts.

They tell us that we can do 85 m.p.g. with sidecar and passenger, instead of the usual 50 to 60 with our high-powered outfits, but forget that the little 'bus will probably want new big and little end bearings in about 4,000 miles, at best, whereas I have just seen an 8 h.p. machine which has carried a heavy sidecar and two heavy people a distance of 7,000 miles, and there is no trace of wear in any part. The same thing applies to all the working parts. Wheel bearings, transmission, frames, tyres, spokes, and a hundred other things which give satisfaction when the small machine is used for the purpose for which it was designed, will certainly not stand the strain of hauling along such an admittedly unmechanical contrivance as a sidecar.

A few years ago I did a lot of hard solo riding, and started off with a 2¾ h.p. single-cylinder. It was game, but could not stand the racket for long. Then I got a 3½ h.p. single-cylinder two-speed. That was much cheaper to run, but still required too many replacements for my liking, so I got a 4-5 h.p. twin, with infinitely variable gear.

That was far and away the cheapest solo machine I have ever owned. Its extra power gave me all the speed I needed to do long daily trips; it meant that it was always working well within its power, it needed decarbonising about half as often, and scarcely ever required any new parts. It did 85 m.p.g., 5,000 miles on a 1in. belt, and 5,500 miles on a 26in. × 2¼in. Rom tyre on the back wheel.

I think it is heart-breaking to see a 3½ h.p. machine hauling a sidecar. ELDON.

Reading.

Sir,—I notice with interest your contributor's account of a holiday tour with a 2¾ h.p. sidecar outfit, and can personally testify to the ability of a low-powered machine to give full satisfaction in this respect.

My motor cycle, a 1920 2¾ h.p. Douglas, three speed and clutch, with a light sidecar and passenger, made two return journeys from Leicestershire to Brighton in July last, *via* Buckingham, Slough, and Dorking, and on the second occasion I did a fortnight's touring in Sussex with Uckfield as a centre, the journeys, including trips to Tunbridge Wells over Crowborough Beacon (twice), Lewes, Brighton, Eastbourne, etc. School Hill, Lewes, was climbed on four occasions, the last time with an extra amount of luggage.

The particulars, as near as possible, were: Weight of motor cycle and sidecar, 263 lb.; driver and passenger, 294 lb.; luggage, 70 lb.; total, 627 lb. Distance travelled, 1,021 miles.

The only hill where foot assistance was necessary was on the long hill out of Amersham towards Beaconsfield, commencing with a very sharp corner.

Finally, the Douglas has done over 2,000 miles sidecar work since delivery in May last, the tyres have not been touched, belt required no adjustment till August Bank Holiday, and the engine, taken down once, required very little decarbonising. J.G.B.

Market Harborough.

A DEFENCE OF THE TWO-STROKE.

Sir,—The criticism of my article on the occasional defects in two-stroke machines, signed "B 3972," does not strike me as being remarkable for its consistency. First, this gentleman (who prefers a number instead of a name) accuses motor cycle journalists, notably myself, of devoting too much attention to the big four-stroke, to the exclusion of the two-stroke. Secondly, he alludes to my favourite mount, "the Scott"; and, thirdly, he proves to his own satisfaction that I have had no experience worth speaking about with two-stroke engines!

The fact that my baby two-stroke often four-strokes may be owing to my inability to drive it properly; but if irregular firing with this type of engine can be eliminated only by expert driving, it should be written off as a defect in the breed. The two-stroke represents the machine for the multitude, not merely for the expert two-stroke specialist, and while defects sometimes, or commonly, exist which hinder it in the fulfilment of that ideal, its advocates have no cause to take offence at criticism keeping us alive to acknowledged facts.

My article was written with a full appreciation of the sterling merits of most two-strokes of the day, and there was really no need for "B 3972" to rush off into defensive glorification of the breed. It is not surprising to learn that he regularly obtains 100 m.p.g. from an ordinary two-stroke. As stated in my original article, I have regularly obtained 180 m.p.g.; but, whereas any moderately-skilled tuner can tune up any old 500 c.c. four-stroke to do 120 m.p.g., there are, unquestionably, many tiny two-strokes which cannot be induced by any amount of tinkering to attain 100 m.p.g. The breed varies so very considerably that it cannot be regarded as having attained the stage of settled perfection realised by the four-stroke, and until the dud rider can depend upon even running and low consumption from any recognised make of two-stroke, level-headed criticism appearing in the technical press is bound to reflect favourably on the interests of the purchasing public.

The position as regards the two-stroke of to-day might be summed up as follows: In some respects it is far and away ahead of the four-stroke of the same c.c.; in other respects it falls far short. That its commonest defects are not inherent is proved by the fact that they are not possessed by all, and therefore have no right to exist in any. Retain its superlative features, wash out its shortcomings, and the four-stroke will have to look to its laurels. Improve the two-stroke, and you will automatically improve the four.

CHINOOK.

MOTOR CYCLISTS AS OUTRIDERS.

Sir,—In a recent edition of *The Motor Cycle* the employment of motor cyclists as outriders during H.M. the King's visit to the Isle of Man was mentioned as a comparative novelty; but, if this is so, I am afraid we are behind some other countries in this respect.

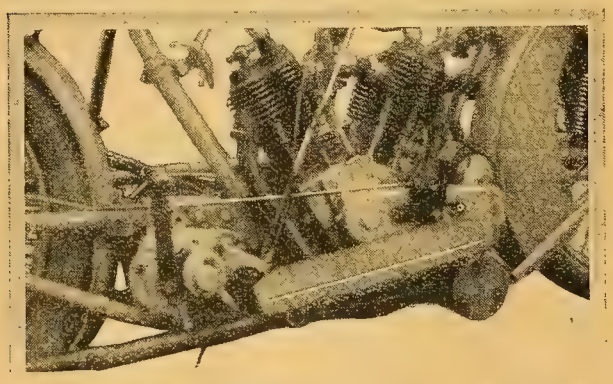
Many of your readers who were in Cairo or Alexandria during the war, and those who are permanently there still, have watched the Sultan driving through the city in his magnificent large red car preceded by a small "squadron" of soldier motor cyclists, who clear the way, and generally act as an escort.

I also happened to be in New York during the visits of the British and French Missions, and saw their respective chiefs, Mr. Balfour and Marshal Joffre, drive through the city on the occasion of their official reception, and on both occasions they were very heavily and carefully guarded, not only by the detectives and Secret Police, who overcrowded the actual car they were travelling in, but also by a large number of police and detectives on motor cycles, who certainly performed their duties most efficiently; so perhaps *our* Home Office might adopt this method of escorting celebrities, etc., also. A.B.C.

Greenock.

AN INTERESTING RENOVATION.

Sir,—The photograph, showing a 1914 three-speed hub gear, 6 h.p. B.A.T.-J.A.P., somewhat converted to modern lines, may be of interest to you; it has now a "Jukes" three-speed box, clutch and starter fitted, wheelbase being lengthened 3in. to allow this. The "family" sidecar seats two comfortably, and was made locally to my sketches, being some-



Improvements to a 1914 B.A.T. described in the letter of T. Cordery, who states that many pleasant hours were spent last winter in converting his machine to a countershaft gear model

what barrel shape at centre to allow width for comfortable seating; the work involved gave many hours of pleasant labour last winter, which has amply been repaid.

T. CORDERY.

CONTRASTED "JUSTICE."

Sir,—Will you kindly allow me to give a word of warning to fellow motor cyclists whose pleasure or business takes them through the village of Amersham (Bucks)? The local police appear to be out to make themselves as unpopular and obnoxious as possible, as the following details will prove.

On August 2nd I was proceeding from Kensington to Amersham to act as timekeeper in a reliability trial organised by my club, when, within less than 100 yards of my destination, I was pulled up by a constable, who abruptly informed me that I was driving my Indian combination in a manner dangerous to the public. Such a charge was ludicrous, as there was not a vehicle in sight nor a soul on the road, neither was my speed excessive or my driving erratic. At the hearing of the case seven weeks later the prosecution called no fewer than four witnesses. Goodness knows where they were at the time of the alleged offence! In the absence of a witness for the defence, all adverse evidence was meekly accepted by the bench, and I was convicted and mulcted in the sum of £10, plus £1 costs. This for a first offence! Compare this imposition with the case of a drunken man driving a combination in Fenchurch Street, E.C., who was, at the Mansion House, fined £3! Surely it is high time that such unfavourable comparisons should be rendered impossible, and that rural benches are brought into line with the more just bodies who mete out punishment fitting to the offence.

Take my advice (if you value the contents of your pocket) and give Amersham a miss whenever possible.

ALAN W. DAY.

A MYSTERIOUS ACCIDENT.

Sir,—I have been much interested in the accident which befell Mr. Boyce, as I had a somewhat similar experience about five years ago.

I am a rider of the opposite sex, and have owned and ridden a motor cycle ever since I left school in 1913.

At the time of the accident I was riding a lady's Douglas, and I remember quite clearly seeing that the speedometer was registering 35 m.p.h. After that I remember nothing more until I hit the road with considerable force, and found the back wheel of my machine buzzing round a few inches off my nose! Being rather a "lightweight," on picking myself up, I found I was as fit as a fiddle, bar a bruise or two, the only damage to the machine being both footboards broken off and sundry scratches to the enamel.

I examined the road most carefully, and found nothing to account for the mishap. I had no "wobble." I was not tired, as I had only ridden thirty miles. I have never fainted in my life, and have nothing the matter with my eyesight. I rode that same machine over 10,000 miles before I sold it, and have never had a similar experience on that or any other machine, and am at a loss to account for it.

In concluding, may I say that I, like "Fairplay," have always met with the greatest courtesy and kindness from all motor cyclists on the road. I find they are always ready to do the very best they can to help, and I, for one, am very grateful to them. DARDENELLA.

Beckenham.

SUMMARY OF CORRESPONDENCE.

We have recently received so many letters of appreciation of various garages' and manufacturers' treatment of their customers that it is impossible to publish them in full. This is a very desirable state of affairs; and the only recent complaint (from Major Beadnell) refers to the abominable treatment meted out to his Douglas outfit by a nameless village repair shop. Messrs. G. E. Smith, P. H. Davie, and G. K. Gibbs respectively praise the work of the Belmont Garage, Bournemouth, the Auto-Electrical and Car Engineering Co., Swansea, and Messrs. W. and L. Leicester, St. Helens; while Messrs. A. Clegg, L. C. Wakeman, W. Lewison, S. J. Granfield, L. F. Barnes, and W. H. Goodenough respectively report generous treatment from Messrs. C. A. Vandervell, John Marston, Ltd., the Villiers Engineering Co., A. Green (Manchester), the Electric Ignition Co., and the Massey-Arran Motor Co. Further letters on the subject of Mr. Boyce's accident continue to reach us, but none of them so far contain a very probable solution.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles Seventh Edition.	2/-	2/2
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/2
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Angle of Magneto.

Will you please tell me how to find out the angle of a twin magneto?—J.M.W.

If the degrees are not marked on the magneto, you must measure the angle between the leading ends of the two cams. From this figure deduct 180°, and double the remainder. This will give you the angle of the magneto. For example, if the magneto is one to suit a 50° engine, the angle between the leading ends of the cams will be 265°. Deducting 180° from this gives 25°, which doubled gives 50° as required.

Flat Twin Two-stroke.

(1.) What kind of magneto do I require to fire a flat twin two-stroke engine in which both cylinders fire together? (2.) Can I use a single-cylinder magneto, and if so, how can I take two leads from the same carbon brush? (3.) If two such leads are taken would they fire both plugs equally well, or would the plug with the minimum gap take all the spark?—E.C.L.

(1.) You require a special double spark magneto for this engine. (2 and 3.) A single-cylinder magneto cannot be used satisfactorily.

Engine Vibration.

(1.) I have been troubled some time with engine vibration, which not only makes the machine uncomfortable to ride, but has caused broken petrol pipes, tank bracket, and several cracks in the tank, and I wish to check the balance of the engine. Can you tell me how to find out which is too heavy, the piston or the balance weight? and how much? (2.) If the balance weight is too heavy how can it be most easily corrected?—R.E.C.

The balance weight (at the same distance from the main shaft as the crank pin) should equal the weight of the rotating masses plus half the weight of the reciprocating masses. The crank pin, big end, and lower half of the connecting rod constitute the former, and the top part of the connecting rod, small end, gudgeon pin, and piston, the latter. It is just possible that the balance weight is too heavy, but in all probability it will be the piston from which the weight must be taken. We do not recommend you to make any attempt to alter the balance—it would be better to return the engine to the makers, pointing out its defects.

Blowing Back through Carburetter.

I have just dismantled my 2½ h.p. two-stroke motor cycle, crank case and everything, and given it a good clean. Now when I start the machine I get a lot of blowing back through the carburetter, and I do not seem to have as much power as I had before. Hills that I used to climb on top gear I now have to finish on second gear. Apparently the crank case is air tight, as also are the cylinder joints and exhaust. I have screwed up the Senspray carburetter as hard as possible to the induction pipe. Do two-strokes have to run for a few miles after being cleaned to run themselves in? When I near the top of a hill, in top gear, just before I have to change into second I get a lot of blow back through carburetter.—P.A.C.

Blow-back through the carburetter of a two-stroke is usually due to the mixture being too weak, but it might be caused by the ignition being unduly retarded. During the cleaning operations, you may have allowed a small amount of dirt to enter the carburetter, and this has possibly partially choked the jet. If this is not so, check the timing. The spark should occur when the piston is on top dead centre with the ignition control fully retarded. You do not state whether you removed the piston rings when cleaning. If you did this and scraped out the carbon in the grooves behind the rings, it is quite likely that you will have to run the machine some distance before it regains its normal power.

Rear Light from Magneto.

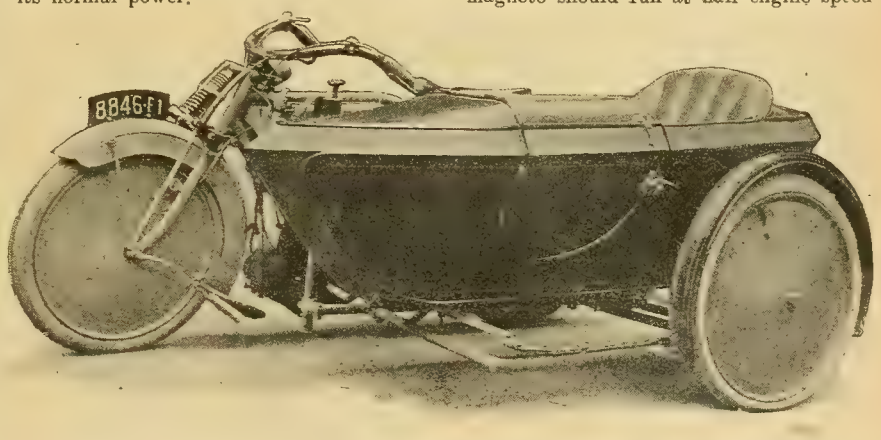
(1.) Can a rear light be obtained from a single-cylinder magneto? (2.) If so, can you give me the dimensions of choking coil gauge of wire, number of turns and diameter of core and length? (3.) To which part of magneto should the wire be attached?—G.P.L.

(1.) You can obtain a light from the single-cylinder magneto if a low-tension switch is fitted on the contact breaker. (2.) The size of the choking coil would have to be determined experimentally, but a complete outfit is on the market, and can be obtained from most of the leading accessory houses. (3.) The connection is made to the low-tension switch.

Conversion to Magneto Ignition.

I have an old gas engine with slide valve ignition. The slides have been faced up so often that they are now worn out on the ignition side through getting scored by carbon deposit. Otherwise the engine is perfect. I intend to fit a magneto and to run it at crankshaft speed. Would a Bosch D.A.2 open type suit, and would an ordinary plug serve?—D.K.

Your question is rather outside our sphere, but you require a single-cylinder magneto running at half engine speed. The D.A.2 magneto would not be suitable unless you remove one of the high-tension brushes, and also the corresponding cam from the contact breaker. This magneto should run at half engine speed



It will be seen that very graceful lines have been obtained in this sidecar designed by the French firm of Garnier and Co., who are exhibiting at Olympia. There is a touch of the nautical about the body, by reason of its pointed bow, its rounded stern, and its curved deck. The workmanship and finish are excellent, and these may be taken as an indication of the close attention that is now being given in France to motor cycle development.

Changed Engine Number.

I bought a motor cycle last month, second-hand. There is no year of make stated on the receipt, nor did the seller commit himself to any year; he merely stated that according to engine number it must be a 1913-14 model. I found the cycle not pulling too well and decided to forward it to the makers to have it thoroughly overhauled. The makers now advise the receipt of the machine, but state that, instead of engine number being 2622, as stamped on it, the real number is 622, and the model a 1910 one, a "2" having been put in front of engine number by some previous owner. (1.) Does this constitute fraud? (2.) Could I legally claim for the return of my money? (3.) As the seller states that he was selling the machine on behalf of another party (whose name he refuses to give), am I right in taking proceedings against him as the seller?—J.R.

No doubt the engine number was changed fraudulently, but you would have to prove that this was done by the person from whom you bought the machine, before you could claim anything from him. If you can prove that the number was changed by the last owner, you could legally claim for a return of so much of your money as would compensate for the difference in value between a 1913 and a 1910 model. You would, of course, proceed against the person who sold the machine, as presumably he was acting as agent for the actual owner.

READERS' REPLIES.

A Remedy that Acted.

Three or four weeks ago you were good enough to suggest a remedy for my Enfield, viz., stronger valve springs, and having tried the 'bus after applying it, I am now writing to express my warmest thanks to you for your advice. The "cure" was instant and complete, and worked a marvellous transformation. Your most valuable aid was all the more welcome since an expert to whom I sent the machine for overhaul had failed to spot the trouble.—A.J.G.

An Untraceable Squeak.

I had a similar trouble to that which "R.P." describes in the issue of September 23rd, and I traced it to the cylinder. On removing it I found a ridge of carbon round the top edge of the piston, on the transfer port side, and after this was cleaned off the squeak ceased.—T.H.K.

EXPERIENCES REQUIRED.

"H.F." (Dublin).—2¾ h.p. Coulson B. as a solo mount, particularly with regard to petrol consumption, cost of up-keep, and hill-climbing. Is a kick-starter advisable?

"A.W." (Bournemouth).—1920 2¾ h.p. Wooler; reliability, power, and economy.

RECOMMENDED ROUTES.

WISBECH TO WOODFORD.—L.V.H.

March, Chatteris, Somerham, St. Ives, Cambridge, Chesterfield, Newport, Bishop's Stortford, Epping, and Woodford.

WOODFORD TO NORTHAMPTON.—D.E.F.

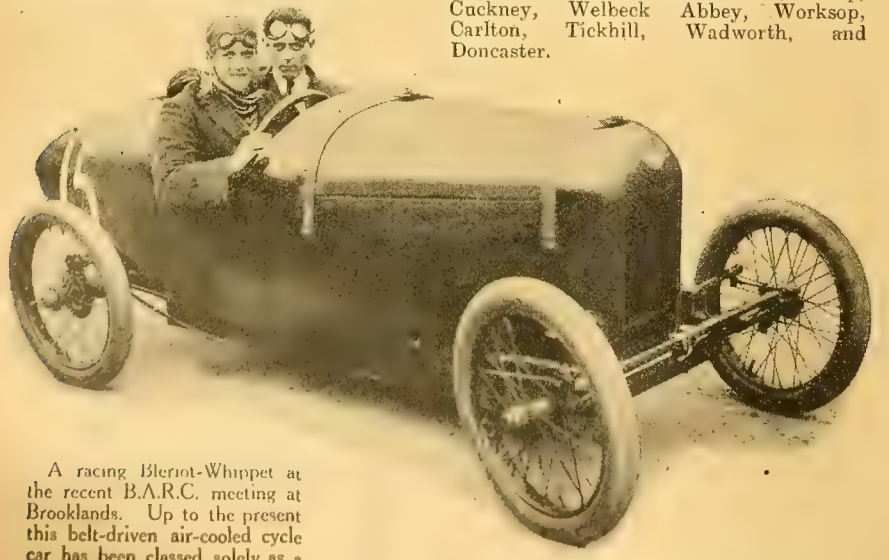
Barnet, St. Albans, Redbourn, Markyate, Dunstable, Hockliffe, Woburn, Newport Pagnell, Gayhurst, Stoke Goldington, Hackleton, and Northampton.

BIRMINGHAM TO BRADFORD.—O.S.

Birmingham, Sutton Coldfield, Lichfield, Burton, Derby, Heanor, Ripley, Alfreton, Clay Cross, Chesterfield, Dronfield, Sheffield, Barnsley, Wakefield, Ardsley, Dudley Hill, Bradford.

BIRMINGHAM TO DONCASTER.—A.F.J.

Erdington, Sutton Coldfield, Bassetts Pole, Tamworth, Nomans Heath, Measham, Ashby-de-la-Zouch, Castle Donington, Sawley Station, Sandiacre Hill, Stapleford, Bramcote, Lenton, Nottingham, Mansfield, Market Warsop, Cuckney, Welbeck Abbey, Worksop, Carlton, Tickhill, Wadworth, and Doncaster.



A racing Bleriot-Whippet at the recent B.A.R.C. meeting at Brooklands. Up to the present this belt-driven air-cooled cycle car has been classed solely as a touring vehicle, but with its streamline body and a high power-weight ratio it should prove a speedy machine also.

SPARKLETS

Tamplins in 1921.

Excepting for minor improvements the present model of the Tamplin runabout will remain unaltered for 1921.

Instructions for Burman Gear Users.

A leaflet containing helpful hints with regard to the popular Burman gear box, and instructing users how to get the best out of it, is now available. It may be obtained from Messrs. Burman and Sons, Ltd., Ryland Road, Birmingham.

Patents for Inventions.

A booklet recently issued by Messrs. King's Patent Agency, Ltd., 146a, Queen Victoria Street, London, E.C.4, should be of interest to those of our readers who are thinking of taking out patents, as it contains much useful information on the subject.

The A.B.C. Skootamota.

The manufacturers of the A.B.C. Skootamota (Messrs. Gilbert Campling, Ltd., 1, Albemarle Street, Piccadilly, London, W.1), state that their output will be in no way affected by the closing down of the Sopwith Aviation Company's A.B.C. motor cycle works, as they are not connected.

"A Word about The Wolf."

A catalogue of the Wolf motor cycles has been issued, which describes the 2¾ h.p. Blackburne-engined model; the Model B, fitted with 2½ h.p. Villiers two-stroke; and the Model C, fitted with 2¾ h.p. J.A.P. engine. Copies will be sent to readers on application to the Wulfruna Engineering Co., Ltd., Brickkiln Street, Wolverhampton.

The A.A. and M.U. Handbook.

The new edition of this handbook for the use of members contains a considerable amount of useful information to motorists in a very small compass. In the section devoted to the A.A. and M.U. patrol system, mention is made of the A.A. first-aid sidecar machines, equipped with spares, accessories, and tools, and driven by mechanics. Amongst other information is a list of 2,700 appointed hotels and garages, and an A.B.C. guide to the motor laws.

Electrical Equipment.

We are in receipt of the latest catalogue of Hunt's motor cycle accessories, published by Messrs. A. H. Hunt, Ltd., H.A.H. Works, Tunstall Road, East Croydon, Surrey, which includes details of complete electric lighting sets and lighting accessories.

A separate catalogue is also issued dealing with Hellesen dry batteries. (We have had one of this type in use since the end of March, 1915, and it still appears to be as full of life as ever.) A separate leaflet is devoted to the H.A.H. dry battery hand lamp.

A Motor Cycling Club for Thanet.

We hear that a club has been formed for the Isle of Thanet district, and a meeting is being held on the 14th inst. to discuss matters in general. The subscription is one guinea a year, and the hon. sec., Mr. G. T. Vaughan, Minster (Kent), will be glad to hear from motor cyclists who are interested.

Ealing and District M.C.C.

The above club will hold a hill-climb in the vicinity of Dorking on October 23rd. This will be the last competitive event of the year. The Upton Challenge Cup, presented by the Hon. Mountjoy Upton, will be decided on formula and will be awarded to the rider making the best performance of the day. A prize will be presented for the fastest time of the day, while silver medals will be awarded to the winner of each class.

North-western Centre A.C.U.

A challenge trophy and series of twelve replica cups were presented to this centre by Messrs. J. Blake and Co., of Bold Street, Liverpool. The first mentioned has been won this year by the Warrington M.C. The Stalybridge, East Lancashire, Bury, Bolton, Liverpool, Manchester, North Cheshire, Warrington, Burnley, and Widnes Clubs each have one of the replicas (two, so far, are not allocated). Hence the many Blake Challenge Cup Trials held during the past year in the North-western district.

Stockport M.C.

The results of the successful hill-climb held by the above on the 25th September in Derbyshire are appended. The event was particularly well attended, attracting 102 entries, which very possibly constitutes a record for a closed club event.

CLASS 1.—1, O. E. Carter (Levis), 1m. 53⅕s.; 2, Miss Cowley (Levis), 2m. 42⅖s.; 3, G. Hall Hallam (Dreadnought), 2m. 49s.

CLASS 2.—1, G. Cowley, senr. (A.J.S.), 1m. 27⅘s.; 2, Miss Cowley (Douglas), 1m. 45s.; 3, P. H. Boyd (New Imperial), 2m. 6⅗s.

CLASS 3.—1, E. S. Abram (A.B.C.), 1m. 16⅘s.; 2, J. R. Cruickshank (Norton), 1m. 19⅗s.; 3, T. Simister (Norton), 1m. 19⅘s.

CLASS 4.—1, G. Cowley, junr. (Norton), 1m. 13⅘s.; 2, E. S. Abram (A.B.C.), 1m. 16s.; 3, T. Simister (Norton), 1m. 16⅘s.

CLASS 5.—1, E. Bottomley (Harley-Davidson), 1m. 9⅘s.; 2, G. Cowley, junr. (Norton), 1m. 14s.; 3, E. S. Abram (A.B.C.), 1m. 14⅘s.

CLASS 6.—1, E. S. Abram (A.B.C.), 1m. 14⅘s.; 2, L. Smith (A.B.C.), 1m. 30s.; 3, F. Cheetham (A.B.C.), 1m. 31s.

CLASS 7.—1, S. A. Crabtree (A.J.S.), 2m. 1s.; 2, G. Cowley, senr. (A.J.S.), 2m. 4⅘s.

CLASS 8.—1, G. Cowley, junr. (Norton), 1m. 52⅘s.; 2, T. Simister (Norton), 1m. 46⅘s.; 3, B. Caldwell (Norton), 1m. 57s.

CLASS 9.—1, E. Bottomley (Harley-Davidson), 1m. 23⅘s.; 2, G. Cowley, junr. (Norton), 1m. 33s.; 3, T. Simister (Norton), 1m. 38⅘s.

CLASS 10.—1, E. Bottomley (Harley-Davidson), 1m. 25⅕s.; 2, G. Cowley, junr. (Norton), 1m. 32⅘s.; 3, T. Simister (Norton), 1m. 38s.

Fastest time of the day, E. Bottomley, 1m. 9⅘s.

SPECIAL PRIZES.—J. L. Cruickshanks (Norton), best performance (500 c.c.) by private owner; H. Wild (A.B.C.), best performance by private owner); W. Preston (Sunbeam), best performance (600 c.c. sidecar) by private owner.

Week-end Club Events.

Oct. 14.—Berwick and District M.C. Annual Dinner.
Oct. 16.—M.C.C., Ltd. One Day Reliability Trial.
Oct. 16.—Southampton and District M. and M.C.C. Hill-climb.
Oct. 16.—Coventry and Warwickshire M.C. Reliability Trial and Closing Run.
Oct. 16.—Sutton Coldfield and North Birmingham A.C. Sutton Cup Trial.
Oct. 16.—Bedford and District M.C. and L.C.C. Club Run.
Oct. 16.—Glasgow Western M.C.C. Reliability Trial.
Oct. 17.—N.M.C.F.U. (Portsmouth). Club Run.
Oct. 17.—Stalybridge and District M.C. and L.C.C. Social.
Oct. 17.—Reading and District M.C. and L.C.C. Club Run.
Oct. 17.—Harrogate "Douglas" Trial.
Oct. 17.—Brighton and Hove M.C.C. Hill-climb.
Oct. 17.—N.M.C.F.U. (Coventry). Reliability Trial.
Oct. 17.—Ilkeston and District M.C.C. Club Run.
Oct. 20.—Ilkeston and District M.C.C. Club Run.

Lincolnshire M.C.C.

A reliability trial was held on October 2nd, starting from Horncastle *via* Louth, Binbrook, Caistor, Market Rasen, Wragby, and back to Horncastle (about sixty-four miles). Although the weather was unfavourable all competitors put in an appearance.

The majority finished the course, the winner being H. G. Jennison (2¾ Verus-Blackburne), who made eighty marks out of a possible 100, thus gaining for him the Lincolnshire Motor Cycle Club Silver Cup and gold medal. This was a very fine performance, considering the state of the roads and the difficult route.

A paperchase will be held on October 16th, starting from Wragby, Lincoln.

North Cheshire M.C.C.

A difficult course was chosen for the trial on October 3rd, which eventually proved too stiff for most of the competitors, only seven finally reaching the finish. Among the observed hills were Cowdale and Snow Cop, where many met their Waterloo. Very good performances were made by the following: E. Bottomley (7-9 Harley-Davidson sc.), H. W. Glendinning (3½ Sunbeam), E. W. Wilkinson (4 Indian Scout), T. Jessop (3¾ Scott), and H. Alderley (3 A.B.C.). T. Close (8 Royal Ruby sc.) was troubled by back wheel slip on most of the hills, while B. Eadington made good climbs, but was heavily handicapped by the weight of his 8 Sunbeam solo.

Eastbourne and District M.C.C.

An interesting, although not very arduous, reliability trial was held under the auspices of the above club for the Harold Day and Kett Cups for solo and sidecar machines respectively. The course, which was a circular one of about forty miles, had to be covered non-stop, including two hills and secret checks. The event attracted a good muster, and was enjoyed by one and all. Results: W. J. Hylands, winner of the Harold Day Cup; C. W. Carr, winner of the Kett Cup.

N.M.C.F.U. (Coventry).

A reliability run will be held on the 17th inst. Start, Swan Lane, 10.0 a.m. Entrance fee 2s. 6d. Entries close on Saturday, October 16th, to Secretary T. Mallalieu, 70, Gorton Road, Coventry.

Stourbridge M.C.C.

A sporting half-day reliability trial was held on the 2nd inst., over a circular route which was covered twice, non-stop, and included three observed hills, namely, Hagley Wood, Shut Mill, and Beacon; a flexibility test was held on the first named. This event attracted forty-eight starters, of whom twenty-nine signed the timekeeper's sheet at the finish. The team prize entries included teams from the Worcester and District M.C.C., Kidderminster M.C.C., and the organising club. Rain fell heavily up to the time of the start, thus rendering Shut Mill and Beacon Hill quite formidable propositions, and a heavy crop of failures at these points was reported.

York and District M.C.

The York and District Motor Club held their last trial for the year over a fairly difficult course, including some of the Cleveland hills and moors and the worst portion of the A.C.U. Six Days course in that district. The numerous gates, rough banks, watersplashes, and ridges across the road and a large quantity of farmyard stock on the road were responsible for practically all competitors being late at the Checkers Inn, Slapestones. The day was fine so that the competitors had a very enjoyable and sporting run. G. A. Reed was the winner of the silver rose bowl presented by the Manufacturers' Union, G. Eastwood, a close second, getting a silver flower vase; W. Atkinson, third, a pair of Cooke plugs; and G. Hannon, fourth, a Cooke plug.

Burnley and District M.C.C.

A reliability trial was held on October 3rd for the Blake Challenge Cup.

The route was: Burnley, Fence, Downham, Waddington, Dunsop Bridge, through the Trough of Bowland, Clapham, Austwick, Giggleswick, Bracewell, Colne, Catlow, to the finish at Lane Head. There were thirteen starters, nine of whom finished the course, which was by no means an easy one. The results are as undernoted:

Blake Cup and Three Tyres and Tubes (presented by Messrs. Wood-Milne, Ltd).—W. Place (3 A.B.C. sc.).

Gold Medal (presented by Messrs. Zenith Motors, Ltd.).—H. Pool (6 Royal Enfield sc.).

Sidecar Lamp and Rear Lamp (presented by Messrs. Surridges, Ltd.).—G. Swinglehurst (3½ Bradbury).

Gold Medal for best lightweight performance.—E. Rigg (2¾ New Imperial).

Gold Medal for best heavyweight performance.—J. H. Place (8 Dot sc.).

A French Machine's Success.

The success of the 2¾ h.p. Gillet in gaining first, third, and fourth places in the 350 c.c. class of the Liège-Paris-Liège Trial augurs well for this comparatively recent addition to the ranks of Continental makers.

Registration.

Bedford is the latest county to exceed the 9,999 motor vehicles allowed by one registration symbol, and it has been allotted the additional letters N.M. Those in search of two and three-figure registration numbers, please note.

A Widespread Misapprehension.

The similarity of inlet valve gear no doubt leads many owners of 3 h.p. Enfield machines to think that their engines are of M.A.G. manufacture. This is not so: these machines are made by the Enfield Co., to whom all applications for engine-spares, etc., should be addressed.

The Future of Wages and Prices.

Inflation of the purchasing power in the hands of the public and restriction of, or rather failure of, an increase in output proportionate to wage advances, are, according to an interesting eight-page statement by the Federation of British Industries, the real causes of the prevailing high prices. Those who await an imminent fall would do well to consider an authoritative statement such as that referred to above, which, although it deals mainly with the so-called "vicious circle," makes it very clear that such a reduction is impossible.

Motor Taxation Regulations.

With the inauguration of the new scheme of motor taxation, we may expect changes in the method of administration. Therefore, the Motor Legislation Committee's recommendations on this subject are more than timely, and we hope that the Ministry of Transport will consider them as representing the views of those who, after all, are most concerned in the matter. Briefly, they demand that the present freedom to register anywhere be retained, also the system where the identification number is allotted to the *vehicle* and not the *owner*; while they emphatically condemn the proposed additional registration book as neither necessary, advisable, nor justifiable.

Motor Cycling in Ireland.

Motor cycling in Ireland is not quite on a level with the pastime in this country. A reader recently was pulled up very forcibly by a wire across the road, which caused severe injuries.

Milan-Naples.

The condition of the roads in this important Italian road race may be judged by the low proportion of finishers—only eight out of thirty-four starters. Miro Maffeis (4 Indian Scout) was first, completing 893 kilos. in 22½ hours, an average speed of 39.58 k.p.h.

Brakes on Racing Machines.

Should racing machines used on Brooklands track be equipped with brakes, is a question discussed in a leading article in this issue. Attention has been called to the subject by the serious accident which occurred at the last Brooklands meeting, when H. R. Harveyson was unable to stop after crossing the finishing line.

Special Features.

OVER WELSH PASSES.

A TOUR OF THE CORNISH COAST.

MAKING A SIDECAR.

A Sporting Club Event.

Commendable features of the one-day trial, for solo motor cycles only, to be organised by the M.C.C., are a comparatively late start and an early finish. There will be two non-stop sections of fifty miles, and the start will be at Purley, at 10 a.m. on October 16th.

"The Springing of Motor Cycles."

A paper on this subject will be read by Mr. C. H. Savage at the second meeting of the session of the Institution of Automobile Engineers on October 28th at the Chamber of Commerce, New Street, Birmingham. A card of invitation may be obtained on application to the secretary, 28, Victoria Street, S.W.1.

PREPARING FOR EMERGENCY.

One could not seat six adults on a light car with the same comfort as has been obtained on this James sidecarrier, which is equipped with five Tan-Sad seats. Incidentally, this outfit was prepared in case a stoppage of the railway prevented transit to and from the suburbs to a City business house.

POWER-ALCOHOL.

NO more pressing problem exists to-day than that of an alternative motor fuel. The development of the industry is being hindered by the prohibitive cost of petrol and benzole. Every motor cyclist should assist the campaign in favour of a home-produced petrol substitute. The Government are beginning to move in this matter. The first need is a suitable denaturant.

Aggregate Performances during 1920.

In the list of aggregate performances at Brookands during 1920 V. Horsman (Norton) heads the list with 92 marks. J. Emerson (A.B C.) is second with 91 marks, and W. A. Jacobs (Singer) 82 marks.

Imports and Exports for September.

September Board of Trade returns show the very pronounced decrease of £43,010 in the value of foreign motor cycles and parts imported compared with the previous month. The actual figures are:

IMPORTS.

	Sept., 1913.	Sept., 1919.	Sept., 1920.
Number of motor cycles	73	188	105
Value of machines and parts	£11,002	£15,872	£22,774

On the other hand, British exports have considerably increased — 156 machines more than the number exported during August, and an increase of nearly £25,000 in their total values.

BRITISH EXPORTS.

	Sept., 1913.	Sept., 1919.	Sept., 1920.
Number of motor cycles	1,296	664	2,815
Value of motor cycles only	£58,165	£44,614	£227,745
Value of parts and accessories	£17,342	£29,244	£63,528
Total value	£75,507	£73,858	£291,273

North-western Automobile Association.

The trustees of the North-western Automobile Association are desirous of hearing from the officials of clubs that were affiliated with it, previous to its suspension. There are some funds in hand which will be duly apportioned if application is made to Mr. F. Whitehouse, 33, Market Place, Oldham; or Mr. C. E. Kettle, 68, Albion Street, Leeds, who wish to wind up the affairs of the Association.

The Imperial Motor Transport Conference.

The 1920 Imperial Motor Transport Conference, organised by the Imperial Motor Transport Council, is to be held during the week beginning October 18th. A limited number of tickets may be obtained from Mr. H. W. Wyatt, the Imperial Motor Transport Council, Royal Automobile Club, Pall Mall, London, S.W.1.

Several lectures will be delivered which will be of general interest to all motor vehicle users. These deal chiefly with the question of motor fuels.

At 10.30 a.m. on the 18th inst., Mr. E. S. Shrapnell-Smith, C.B.E., M.Inst.T., will lecture at the Pillar Hall, Olympia, on "Motor Fuel Supplies and Prices." At 2.30 p.m. on the same day and at the same place Mr. Harold Moore will lecture on "The Increased Production of Petroleum Spirit," and Mr. George Howell will read a paper on "Petroleum Spirit: Distribution Methods and Efficiency from Well to Consumer." On these two occasions Sir John Cadman, K.C.M.G., C.B., will occupy the chair. On the 19th, at the Pillar Hall, Olympia, Mr. John Wells will read a paper on "Fuel from Waste Vegetation," and Sir Charles Bedford will read a paper on "Power Alcohol in Relation to State Control." In the afternoon of the same day, at 2.30, Dr. Ormandy will read a paper on "Why Power Alcohol is not yet on the Market"; and Mr. G. J. Shave will lecture on "Some Results and Experiments with Alcohol Fuels by the London General Omnibus Co., Ltd." At 10.30 a.m., at the Pillar Hall, Olympia, on Wednesday, the 20th, there will be a discussion on "Roads and Road Development throughout the Empire," opened by Mr. H. C. B. Underdown. Papers will also be read in the afternoon and evening of the same day, and also on the Thursday.

IMPORTANT DATES.

Nov. 4th-13th—
International Automobile Exhibition, Olympia and White City.

Nov. 29th.-Dec. 4th—
Olympia Motor Cycle Show.

Dec 26th-27th—
M.C.C. London-Exeter Run.

Obscured Turnings.

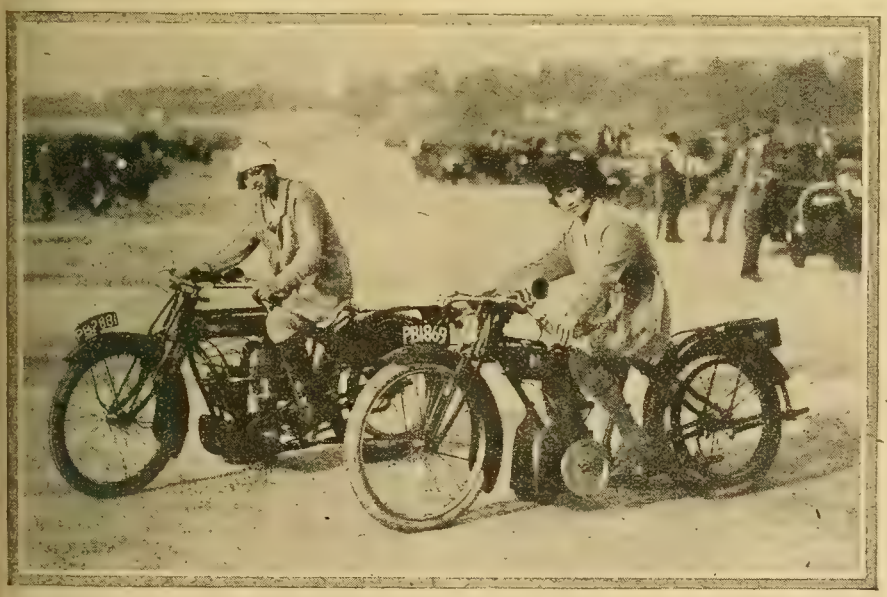
Borough and county surveyors possess considerable powers enabling them to deal with the question of overgrown hedges, bushes, etc., at cross-roads and bad corners; but it is suggested by the A.A. that local landowners also may do much to minimise this danger at little or no expense.

Revelations at Wolverhampton.

At the Wolverhampton meeting of the I.A.E., Mr. Cyril Williams was unable to read his paper owing to indisposition, but an interesting debate on "The Racing Motor Cycle" was opened by Mr. Greenwood, the well-known Sunbeam designer. Some of the points discussed were the design of valve-gears for high-speed engines, aluminium pistons and valve steels. Regarding the last mentioned, high chromium steel was said to be very satisfactory. Mr. H. Stevens (of A.J.S. fame) raised some novel questions, including the effect of the personality of the rider and designer upon results. It was mentioned that compression ratios of as high as six to one were used for sprint work, but were not suitable for road racing. Is this one of the secrets of the wonderful $2\frac{3}{4}$ A.J.S.?

The Trial over Welsh Passes.

At the time of going to press we have received an interesting sidelight on the course chosen for last Saturday's Welsh Trial, particulars of which appear on pages 450 and 451. It seems that complaints have been made by competitors regarding the severity of the course, and that Major Vernon Brook, the A.C.U. steward for the event, came in for a certain amount of invective on account of the fact that he had previously seen it in a semi-official capacity, and had approved of it. It is interesting to know that Major Brook reported the hill at Harlech as being almost unclimbable when dry, and quite unclimbable when wet, and it was suggested by him that the hill should be a bonus one rather than a penalising one. Major Brook makes this explanation in fairness to the A.C.U., which body had nothing to do with planning the course. Next week we hope to deal more fully with the severity of present-day trials.



Lady motor cyclists who are keenly interested in Brooklands activity. (Left) Miss K. Don (Zenith) and Mrs. H. S. Powell (M.T.)

AUTUMN TRIAL OVER WELSH PASSES.

Four New Test Hills in Event organised by the Midland Cycle and Athletic and South Birmingham M.C. Clubs.

NEW trials ground was broken last Saturday by the sixty-nine competitors in the joint event of the Midland Cycle and Athletic and South Birmingham M.C. Clubs. The course was over the Welsh mountain passes, and included at least two hills which might not have been considered had not it been planned for a summer trial.

A Process of Elimination.

Anyone who read the regulations and conditions on the entry form must have realised that the organisers had planned to find winners for the many valuable trophies by a process of elimination without the necessity for a secret check. It was clear that a sidecar machine had practically no chance of winning a gold medal, as the loss of even one mark was sufficient to place a competitor out of the running for a "gold." Probably this was responsible for the comparatively low entry of passenger machines (*i.e.*, 13). All the same no disappointed competitor has cause to complain, as the regulations clearly showed that it was going to be the hardest one-day trial of the year, and that the notorious Alt-y-Bady was not to be the worst hill on the course. To fail on Alt-y-Bady meant a loss of ten marks; on three others the penalty for failing was only five marks. Two of these hills (Gough's Conscience and Whitworth's Grave) were narrow lanes deep in mud for the most part, but presenting no great difficulty so far as gradients were concerned. Another (Urry's Pet) was steep and strewn with boulders that gave it the appearance of a stone staircase, and was considered to be worse than Harden Bank in this year's A.C.U. Six Days by those who had negotiated both. It was so bad, in fact, that all the passenger machine drivers refused to negotiate it.

THE TRIAL IN BRIEF.

Fifty-eight solo and eleven passenger machines started; forty-nine and six respectively finished.

The hardest one-day trial organised this year.

Heavy mists and mud in the mountains.

Gold medals possible for only nine competitors after Alt-y-Bady, one mile from the start.

Drivers of passenger machines refused to negotiate one of the hills.

Reliability of modern machines proved by every rider who finished; autumn conditions reduced trial to a riding test for expert drivers.

Competitors held up for twenty minutes by excited anti-motorist.

The fourth new hill introduced was the Eunant Pass, from Lake Vyrnwy to the top of Bwlch-y-Groes, and could be likened to Stay-a-Little in the 1919 A.C.U. Six Days. As it was perhaps the only one of the four that justified its inclusion in any but a sporting club event, it deserves to go down to posterity under its proper name instead of that given to it by those who planned the course. On the route card it was down as Boydell's Playground—a name, like Urry's Pet, Gough's Conscience, and Whitworth's Grave, suggesting a joke of which only the perpetrator knows the point.

As the trial started and finished at Llangollen, it was practically a three days' outing for the competitors, the numerous marshals and others who were interested in the trial. They seemed to fill Llangollen on Friday night, when sporting prophets were offering ten to one against any sidecar climbing Alt-y-Bady next morning.

Saturday morning broke dull and misty. Five-thirty by the sun on such an October morning was very depressing, and there were long faces at the breakfast room window of every hotel in the town.

Long before 8—or 7 by the sun—Llangollen was astir, but it might have been a town on a plain instead of surrounded by mountains for all that could be seen.

Four Minutes from the Start.

Alt-y-Bady was the first hill—a mile from the start—and it was in a very bad condition.

It was certainly a severe test to give riders who had not been in the saddle four minutes. The approach was deep in mud, as was the hill itself, while the bed-rock on the most difficult portion was as slippery as ice.

The listless trees were shedding their leaves and dripping heavy moisture when Eric Williams, on a 2¾ h.p. A.J.S., took the hill in his usual confident style. The first man up, he proved the hill was climbable, but this brilliant prologue was followed by a less meritorious display, for it was not until half an hour had passed that a second rider made a clean ascent. This was W. R. Brown (2¼ Bown-Villiers), who showed that it was not sheer power that Alt-y-Bady demanded.

In the meantime there had been 25 marked down as having failed. Four more riders completed the 350 c.c. class, but no more were marked as V.G. (very good).

Some Clean Performances.

The "over 350 c.c." class promised to be better, as was to be expected, and the successive clean ascents of G. A. Strange (3½ James), H. Langman (3¾ Scott), A. Wood (3½ B.S.A.), and F. A. Largman (3½ Ariel), led one to suppose that perhaps after all it *was* power that Alt-y-Bady needed, but three failures were recorded before L. L. Sealey (4¼ B.S.A.) made the seventh clean ascent out of thirty-nine attempts. Fifteen more failures preceded the clean ascent by G. Townsend (3½ P. and M.), who was the last of the solo men to get up.

The sporting gentleman of the night before must have felt secure when one after another the sidecar competitors lost their chances of a "gold." True, J. L. Stocks (4½ Ariel sc.) made a clean ascent, but his passenger was on the carrier, and he lost marks on that account. Then came W. T. Woodcock on a 3½ h.p. sidecar of the same make. His passenger was normally seated. Woodcock occupied the

T. F. Blumfield (6 Ariel) and H. Green (4 Triumph) on the lower portion of Gough's Conscience.

Dropping down from the mountains obscured in mist, T. F. Watson (4 Norton sc.) runs into the sunshine near the western end of Lake Bala.

carrier himself, and amid the cheers of the spectators he reached the top—the only sidecar competitor to leave Alt-y-Bady behind with a clean sheet. F. J. Watson (6-7 Ariel sc.) imitated Stocks, and gave culminating proof that what Alt-y-Bady wanted, more than power, luck, or even skill, was all three combined with enough weight to prevent the rear wheel spinning.

H. F. S. Morgan (8 Morgan) would probably have made a clean ascent, but, striking the bank, he turned over. He was immediately bounced back again on to a more level keel and, without assistance, finished the climb.

The Second Test Hill.

Two miles over the summit of Alt-y-Bady was the brake test, then a dozen miles of main road and three along a narrow lane to the second test hill known locally as the Bllaenllawes road to Bwlch-y-ddar, but on the route card as Gough's Conscience. The necessity to change the name is obvious.

It proved to be a muddy lane climbing over the hills as a near cut between two main roads. On a dry day few would have failed, but, as it was, it gave a great deal of trouble even before the *pièce de résistance* was reached. This consisted of a rough and loose patch of slimy stones and a stiff gradient, where fully 90% failed through wheel slip; but H. Langman (3¾ Scott), who had a partly deflated rear tyre, shared the star performance with J. Westwood Wills (2¾ Verus), who made an almost equally good climb.

In another two miles the competitors were on to the main road again, but only for a short five miles, then they were directed through a gate, up another narrow muddy lane, this time with its surface sloping to the left—so much so, in fact, that one of the sidecars actually slipped from under its driver, and finished its slide with the sidecar up the bank and the machine lying almost on its side. This was Whitworth's Grave. As on the hill with the unpronounceable name, it was wheel slip that caused the failures, for those who safely negotiated the grease on the first section almost invariably failed on the hairpin.

As a contrast to this muddy lane among the trees, the riders now had five miles of almost trackless moorland. Everywhere the autumn tints were gorgeous, and mountain furze was seen at its best. Then more main road to Lake Vyrnwy and across the great dam which has turned a deep valley into a gigantic reservoir.

The road along the lakeside had been badly cut up by traction engines, and the ruts allowed little opportunity for the solo riders to enjoy the scenery. In four miles the course left the water and the submerged village of Eunant, and on the next three miles the competitors learned that a new pass had been discovered for trials organisers of the future. Every conceivable kind of surface, excepting the kinds known to the average motorist, was encountered. This was the Eunant Pass. The gradients were not very severe, but any machine that could be driven over it at the schedule speed of 15 m.p.h. and survive, at once proved its strength. Half-way up, lying in a hollow, there was a patch of rocks which protruded from the "surface" at all angles, while the track itself sloped acutely to the left—a place one would be wary in walking over in weather conditions like those of Saturday last. Yet the great majority got through—some only to fail a few yards beyond on a few steep yards of mud and stones.

The Summit of Bwlch-y-Groes.

The second section was undulating, but mounting higher and higher after each dip down. Every few yards there were watercourses—some of them deep enough to be termed watersplashes—and at intervals bed rock, or loose slate or mud.

This pass joins Bwlch-y-Groes near the summit, and a wide hairpin had to be taken to get on to the famous hill.

On the summit of Bwlch-y-Groes a stopping and restarting test had been arranged, but not one competitor failed to do all that was required.

Now on to the lunch stop was an easy run of twenty-seven miles to Barmouth. Descending from Bwlch-y-Groes, sunshine was encountered, and the competitors were able to look back at the clouds through which they had come.

An Almost Impossible Climb.

The worst hill had been reserved for the afternoon. The coast road to Harlech was taken immediately after lunch, and, on arriving at that ancient town, the competitors were taken to the foot of Urry's Pet. As before mentioned, it proved to be worse than Harden Bank, for its stone staircase surface was wet and prevented wheel grip.

It was impossible to see who made clean ascents and to define what was a clean ascent. Certain it is no competitor reached the top without using his feet, but the way in which the spectators cheered C. P. Wood (3¾ Scott) suggested that he had completed the climb in a most meritorious manner.

Drivers of passenger machines refused to try the hill, and, finally, were diverted, but by this time most competitors were nearly an hour beyond schedule, which time was allowed to them.

Returning to Barmouth and Dolgelly, the route now lay to Cross Foxes by the mountain road which proved to be very rough and trying. It was alleged that at this point an anti-motorist with a shot gun held up the tail enders for twenty minutes, bringing these competitors an hour and a quarter behind their schedule at the finish.

Speed Test in Low Gear.

A strong head wind increased the difficulty of the climb over Dinas Mawddwy, then came the ascent of Bwlch-y-Groes, half a mile of which had to be taken as a speed test in bottom gear. The machines seemed very slow, and suggested that the drivers did not intend risk breaking a valve by unduly "revving" their engine with so little to gain.

The day had taken its toll. G. Denley (Velocette) had trouble with his ignition, and failed to check in at the finish. F. J. Watson (6 Ariel sc.) was taken ill and elected to stay in Barmouth. A. Phillips (2½ O.K.) was a sixteen-year-old novice who found the course too severe. W. E. Bird (2¾ Marloe) had trouble with a wheel spindle; G. E. Stobart (7 James sc.) punctured and discovered he had lost his pump. He was delayed so long that he decided to withdraw. H. F. S. Morgan (8 Morgan) was not happy about his clutch, and went for a week-end tour after the morning's run.

As regards the machines that finished, a word should be said. The three Allons entered completed the course. The only A.J.S. was a 2¾ h.p. model ridden by Eric Williams. P. Pike (2¾ O.K.) completed the course without leaving the saddle. The Precision-engined Armis machines were consistently good, and, as usual, the Velocettes created a favourable impression.

Of the larger machines, the Triumph, B.S.A., Humber, Scott, Ariels, Norton, and P. and M. all proved their efficiency; while among the sidecars the Ariels undoubtedly made the star performances—three climbing Alt-y-Bady without stopping. T. F. Watson's 4 h.p. Norton sidecar and B. L. Bird's 4½ h.p. B.S.A. outfit were never at a loss for power, and H. B. Denley's Morgan once more proved its reliability.

Of the organisation there can be no word of criticism. It was excellent and the arrowing perfect. There must have been three officials for every competitor and everyone knew his duty, and did it.

A Championship Meeting at Brooklands.

Several Five and Ten Mile Records Broken during Progress of Hotly Contested Races.

GLORIOUS weather, an excellent programme, a fine attendance, and the breaking of numerous records all combined to make the Seventh 1920 Members' Meeting of the British Motor Cycle Racing Club a real success. At this, as at all purely motor cycle race meetings held by the club, the start and finish took place at the fork, an arrangement which renders the races both safe and interesting, and is in fact the only possible place from which motor cycle events may be run with safety and to the satisfaction of the spectators.

All the events were over a five-lap course, and the following awards were given: First prize, cup value £5; second prize, the club's plaque; third prize, a bronze medal.

The meeting opened with the Championship Scratch Race, Class A, for solo motor bicycles with engines not exceeding 275 c.c. Jacobs, on his ancient, but still highly efficient little Singer, had it his own way from the second lap. In the first lap Prestwich (Diamond-Jap) was leading, closely followed by Jacobs and Eve (Martin-Jap), while Carryer (New Hudson) was some way behind.

An Old Lightweight Wins.

In the next lap Jacobs led, with Prestwich second, Eve third, and Carryer still in the rear. In the third lap Jacobs and Prestwich were not quite so widely separated, but the former increased his lead in the fourth lap. Results:

		Speed.
1.	W. A. Jacobs (2½ Singer)	50.25 m.p.h.
2.	J. V. Prestwich (2½ Diamond-Jap)	—
3.	P. Eve (2½ Martin-Jap)	—

The Championship Scratch Race, Class B, was well supported, and there was only one non-starter. K. Don, on an overhead valve A.J.S., showed his superiority from the start, and at the end of the first lap was streets ahead of the others, who passed as follows: Prestwich (Nut-Jap), Thompson (Douglas), Longden (Dot-Jap), V. Longden (Douglas), E. Longman (Wooler), Hull (Wooler), Temple (J.A.P.), Weatherell (R.W.), Sparks (Douglas), McNab (Wooler), and Watson (Watson-Jap). Don forged ahead in the second lap, followed by Prestwich, E. Longden, Thompson, V. Longden, Longman, Hull, Weatherell, McNab, Temple, Sparks, and Watson. In the third round Don was nearly a lap ahead, the order of the next four did not vary, and the runners up were Hull, Watson, McNab, Sparks, and Weatherell. Don's machine was misfiring slightly as he passed the fork in the fourth lap, but he lost no appreciable ground. The order of the followers was: Prestwich, E. Longden, Thompson, Hull, McNab, Weatherell, and Sparks. At the end of the final lap Don was more than a circuit ahead of his competitors, and had broken two records. Results:

		Speed.
1.	K. Don (2¾ A.J.S.)	63.78 m.p.h.
2.	J. V. Prestwich (2¾ N.U.T.-J.A.P.).	—
3.	E. Longden (2¾ Dot-Jap)	—

Also ran: T. Thompson (2¾ Douglas), J. F. Hull (2¾ Wooler), F. A. McNab (2¾ Wooler), and R. Weatherell (2¾ R. W. Scout).

K. Don (2¾ A.J.S.) was successful in breaking records in Class B (350 c.c.), attaining 69·82 m.p.h. with a flying start. The championship scratch race for machines between 275 and 350 c.c. was also won by him.

Don's fastest lap was covered at a speed of 71.91 m.p.h. He broke the ten mile (Class B) record, standing start, time 8 min. 55.6 sec., speed 67.16 m.p.h., and the five mile record, flying start, time 4 min. 17.8 sec., speed 69.82 m.p.h. The previous best for these records was: 10 miles, S. L. Bailey (2¾ Douglas), time 9 min. 16.8 sec.; 64.65 m.p.h., and the flying 5 miles, the same rider and the same machine on the same day, August 17th, 1920, time 4 min. 32 sec., speed 66.18 m.p.h.

There was also a good entry for the Championship Scratch Race, Class C, for motor cycles with engines between 350 and 500 c.c. In this race, as in its predecessor, the winner had it all his own way from the start and increased his lead at the end of every lap, but there were many retirements. All got away well at the start except A. G. Miller.

The First Lap.

Horsman shot ahead, leading easily at the end of the first lap. He was followed by Pope (Matchless-Jap), whose engine was misfiring. Gayford (Duzmo), Dicker (Norton), Chawner (Sunbeam), Gard (Norton), Martin (Martin), Smith (B.S.A.), and Edmondson (Triumph). Horsman was farther ahead at the end of the second lap; and after him came Gayford, Dicker, Martin, Chawner, Gard, Edmondson, and Smith. In the fourth lap the redoubtable Horsman, who heads the list in the 1920 aggregate performances, was followed by Gayford, Dicker, Martin, Chawner, Edmondson, and Smith, who was passed at the fork by the leader, who was entering his fourth lap. Gard gave up, and Chawner retired owing to lubrication trouble. In the fourth lap that fine old rider, Harry Martin, occupied second place, with Dicker third, followed by Smith and Edmondson. Horsman won by a lap, and broke records.

		Speed. m.p.h.
1.	V. Horsman, 3½ Norton (79×100, 490 c.c.)	72.79
2.	H. Martin, 3½ 2-cyl. Martin (64×77, 496 c.c.)	—
3.	R. E. Dicker, 3½ Norton (79×100, 490 c.c.)	—
	Gem. Smith, 3½ B.S.A. (85×88, 499 c.c.) ..	—

Horsman broke the 10 mile record (Class C.), standing start, time 8 min. 8.6 sec., speed 73.68 m.p.h. Previous best: D. R. O'Donovan (Norton), time 8 min. 11.2 sec., speed 73.29 m.p.h., 17th July, 1914, and his fastest lap was covered at a speed of 76.91 m.p.h.

The Championship Scratch Race (Class E) was for motor cycles with engines between 750 and 1,000 c.c. Harveyson was down to enter for this race, but though he had recovered sufficiently to watch the

A Championship Meeting.—

racing, he was naturally unable to take part in it after his narrow escape the previous Saturday. At the outset it looked like being a ding-dong race between Remington and Le Vack. At the end of the first lap Le Vack (Indian) was leading, with Remington (Nut-Jap) close on his heels, Baldwin (Matchless-Jap) was some way behind, and then followed Reed (Dot-Jap), Martin (Martin), Sawer (American X), and Cushman (Zenith-Jap). Remington took the lead at the members' bridge, and led at the end of the second lap, with Le Vack close behind. Save for Martin, who retired, owing to belt trouble, this order of the remainder did not alter. In the third lap Le Vack increased his lead as Remington suffered plug trouble, which he stopped and remedied at the fork, pluckily starting again. Baldwin was now second, and was followed by Reed, Sawer, Cushman, and Remington. In the fourth lap Le Vack still increased his lead, and the only alteration in the order was that the gallant Remington gained a place, and was also lapped by Le Vack at the fork. Le Vack won easily, and broke two records.

	Speed. m.p.h.
1. H. Le Vack (7 Indian)	81.80
2. O. M. Baldwin (8 Matchless-Jap)	—
3. H. Reed (8 Dot-Jap)	—

Also ran: E. Remington (8 Nut-Jap), G. L. Sawer (7 American-X), L. A. Cushman (8 Zenith-Jap).

Le Vack broke the flying five mile record, Class E, time 3 min. 32 sec., speed 84.82 m.p.h., and the ten mile record, standing start, time 7 min. 20⅘ sec., speed 81.67 m.p.h. Previous best: Flying five miles, C. R. Collier (8 Matchless-Jap), time 3 min. 35 sec., speed 83.72 m.p.h., 11th August, 1911, ten mile, standing start, E. Remington (8 Nut-Jap), time 7 min. 31.4 sec., speed 79.71 m.p.h., Sept. 11th, 1920.

There were only six starters in the Championship Scratch Race (Classes F and G) for motor cycles with sidecars not exceeding 500 c.c. Horsman (Norton) led from the first and got well away. O'Donovan (Norton) ran second in the first lap, and after him came Beach (Norton), Cookson (Norton), Chawner (Sunbeam), and Smith (B.S.A.). The veteran O'Donovan took the lead shortly afterwards in the railway straight, and kept his position in the second lap, with Horsman second, Beach third, Cookson fourth, and Smith well to the rear. In the third lap Horsman was an absentee, otherwise the order was the same. The fourth lap saw O'Donovan *hors de combat* with gear box trouble, with Cookson leading, Beach second, and Smith third, in which order the race was finished.

H. le Vack (7-9 Indian), winner of the Championship Scratch Race at Brooklands for 750 to 1,000 c.c. machines. He also broke the ten mile (standing start) and five mile (flying start) records in Class E, attaining 84·82 m.p.h.

	Speed. m.p.h.
1. H. G. Cookson (3½ Norton)	56.69
2. H. H. Beach (3½ Norton)	—
3. Gem Smith (3½ B.S.A.)	—

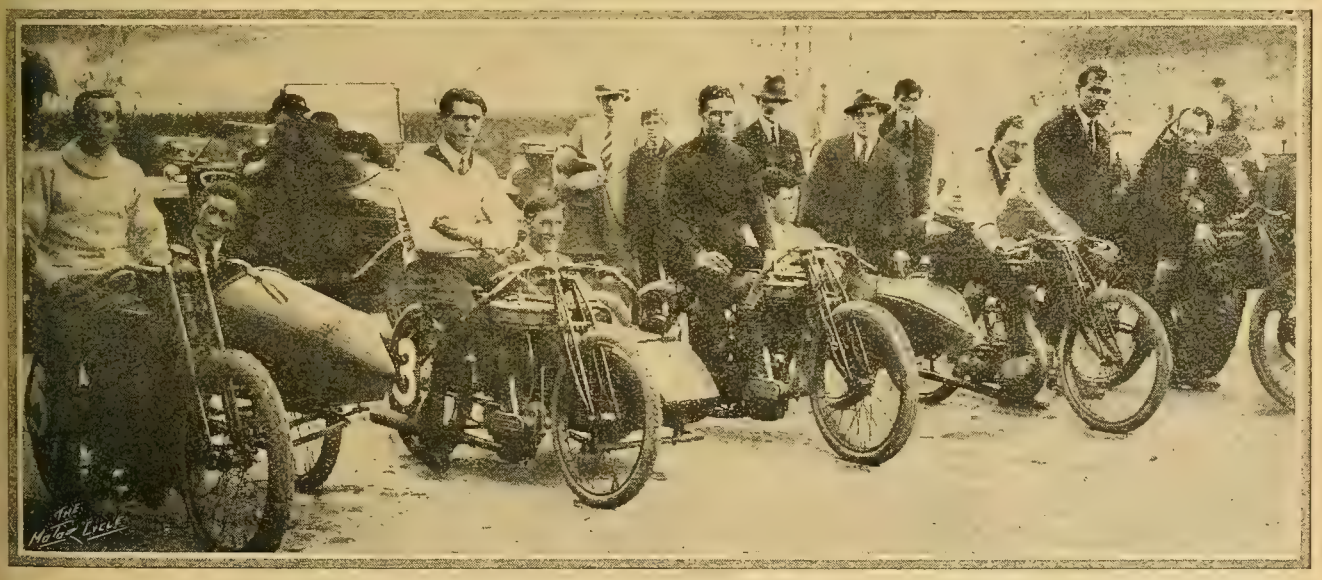
The final event was the championship scratch race (Classes H. and I.). At the start Crawford's Henderson was easily the first away, but the advantage gained availed him but little. Le Vack (Indian) had some difficulty in getting off. From the very first Davidson (Harley-Davidson) had the race to himself, and riding a machine which, to all outward appearances was a practically standard model, he increased his lead lap by lap. The order when passing the fork was: First lap, Davidson, de Lissa (Motosacoche), Le Vack (Indian), Chater-Lea (Chater-Lea), Bond (Zenith), Baragwanath (Zenith), Longman (Harley-Davidson), Dequin (Harley-Davidson), Baldwin (Matchless), Crawford (Henderson), and L. Jepson (Zenith) who had considerable difficulty in starting. Second lap, Davidson, de Lissa, Le Vack, Jepson, Chater-Lea, Longman, Baragwanath, Lushman, Dequin, Bond, and L. Crawford. Third lap, Chater-Lea, Cushman, Longman, Baragwanath, Dequin, and L. Crawford. In the fourth lap the original order did not change save that Crawford was ahead of Dequin. Result:

	Speed. m.p.h.
1. D. H. Davidson (8 Harley-Davidson)	67.47
2. O. de Lissa (8 Motosacoche)	—
3. H. Le Vack (7 Indian)	—

Also ran: H. Jepson (8 Zenith-Jap), E. C. E. Baragwanath (8 Zenith-Jap), L. A. Cushman (8 Zenith-Jap), S. E. Longman (7 Harley-Davidson), and D. Crawford (10 Henderson).

Chater-Lea retired owing to a hole in the piston of his engine. De Lissa made a very fine performance in attaining second place, as he was the oldest driver in the event.

Davidson broke the flying start five mile record (Class I.), time 4 min. 19.2 sec., speed 69.44 m.p.h., and the ten mile record, standing start, time 8 min. 56.8 sec., speed 67.06 m.p.h. Previous best: Flying five miles, D. R. O'Donovan (3½ Norton), time 5 min. 6.2 sec., speed 58.78 m.p.h., 22nd September, 1915. Ten miles, E. C. E. Baragwanath (8 Zenith), time 9 min. 48 sec., speed 61.22 m.p.h., July 17th, 1920.



Experts lined up for a tussle. Left to right: D. H. Davidson (7-9 Harley-Davidson), H. G. Cookson (3½ Norton), V. Horsman (3½ Norton), K. Don (2¾ A.J.S.), and H. le Vack (7-9 Indian).

CLUB NEWS. (Continued from page 447.)

Sutton Coldfield & North Birmingham A.C.

A half-day reliability trial will be held on Saturday, November 20th, over a route in the vicinity of Birmingham, and finishing at headquarters, the Royal Hotel, Sutton Coldfield.

Berwick and District M.C.

The Berwick and District Motor Club held a gymkhana on Monday, 27th September, in the Home Park, Coldstream. The following are the prize-winners for the various events:

SOLO MACHINES.—Slow Race: A. Welsh. Egg and Spoon Race: J. Cumming. Potato Picking Race: G. Gore. Slicing the Lemon: J. Cumming. Slow and Straight Race: G. Gore.

SIDECAR MACHINES.—Picking up Potatoes: J. Cumming. Changing Driver's Race: G. Gore.

Northern M.C.

The Northern Motor Club held its last official event for the 1920 season on the 12th inst., and a most enjoyable and successful day was spent, everything going without a hitch. A picnic lunch was taken, and the day's work was commenced about one o'clock. The event consisted of a speed hill-climb on formula, the winner to hold the Anderson silver gilt cup for twelve months. The rider to take first place was S. Bell (3 A.B.C.), but not being an amateur, according to the club's rule, he could not claim the premier award. Thus the winner of the cup turned out to be A. Detchon (3 A.B.C.) The other awards, which consisted of gold and silver medals, were as follows: 350 c.c. class, 1st, A. Cawthorn (2¾ Douglas). 500 c.c. class, 1st, S. Bell (3 A.B.C.). S. Bell also won the 600 c.c. and unlimited classes. C. Armstrong won the 600 c.c. class for sidecars on a 3 A.B.C. sc., and the unlimited class on a 7-9 Harley-Davidson sc. The fastest time of the day, for which a special gold medal was awarded, was taken by Mr. G. Ross (3½ Norton).

Bradford M.C. and L.C.C.

In this club's speed trials on September 26th over a three-furlong course at Penny-pot Lane, Harrogate, H. O. Wood (3¾ Scott) made fastest time of 17⅘s., while A. Stansfield, similarly mounted, made a good second in 18s.

Dublin and District M.C.C.

The following awards have been made in connection with the concluding event of the Dublin and District Motor Cycle Club, a reliability triel held in Co. Wicklow:

WALKER CUP.—J. Carville (4 Triumph).

FREEMAN CUP.—H. McAllister (A.J.S. sc.).

GOLD MEDALS.—H. W. Nesbitt (4 Douglas), J. Carville (4 Triumph), H. McAllister (6 A.J.S. sc.), A. Carton (4 Indian), and F. Holmes (3½ Rudge).

SILVER MEDALS.—P. H. Hurse (4¼ B.S.A.), J. Browne (2¾ Douglas), E. McEntaggart (7 Indian), S. Woods (7 Harley-Davidson sc.), F. McCullagh (3½ Norton), T. G. Henry (2¼ Velocette), T. E. Green (6 Enfield sc.), A. Wayte (4 Harley-Davidson), P. Murphy (4 Triumph), G. Daly (4 Triumph), T. Murphy (4 Triumph), F. O'Connor (3½ Sunbeam), and Hon. H. Massey (7 Harley-Davidson sc.).

BRONZE MEDAL.—Miss J. Moppett (6 Campion sc.).

North London M.C.C.

Here is a novel idea which worried club secretaries may be able to use to relieve the monotony of ordinary events. Partially hide by the roadside within a prescribed area of about two miles radius, six cardboard boxes of medium size. Despatch competitors from the centre of the selected area, and give them seventy-five minutes in which to find the boxes. Members of the North London M.C.C. found that this was easier said than done, but the scheme provided an excellent afternoon's sport. The three prizes kindly presented to the club by the Dollis Automobile Co., of Finchley, were secured by N. E. Hughes (3½ Sunbeam sc.), R. L. Richardson (3½ Rudge-multi), and F. Roberts (3 A.B.C.).

Bromley M.C.C.

A motor cycle club as above has been formed for motor cyclists in Bromley (Kent) and district. It is proposed later to affiliate to the A.C.U. The headquarters are the Crown and Anchor, Park Road, Bromley, Kent.

N.M.C.F.U. (Rotherham).

All members and anyone interested in motor cycling are asked to attend a special meeting, to be held in the Y.M.C.A., Howard Street, Rotherham, on October 15th, at 7.30 p.m.

Northern M.C.

Amongst many of the social events arranged for by this club for the coming winter, one of the most important will be a "Bal Masque" and Confetti Carnival. The motoring spirit of the club should suggest many novel forms of costume, and it is expected that makes of machines, accessories, tyres and various carburetters will be well represented. Particulars may be had from the honorary secretary. A fixture card has been drawn up for these events and seasonable runs arranged for. Indoor games will be introduced into the club room, and altogether a very enjoyable programme is assured for the coming winter.

North Cheshire M.C.C.

At the time of going to press we learn that the best performances in the recent reliability trial referred to on page 447 were made by E. Bottomley (Harley-Davidson) and T. Jessop (Scott), who tied for first place. Two cups of equal value (one presented by Messrs. Blake and Co. and one by Miss Littlehales and Miss Ferguson) having been offered for the first and second best performances, it was decided that no distinction should be made with these cups, one each being awarded to the two who tied. The course was a stiff one, and included Cowdale.

20 M.P.H. AVERAGE.

Not so easy as it at first appears if Road-Manners are studied.

AN average speed of 20 m.p.h. seems so ridiculously easy that many motor cyclists in planning a journey seldom trouble to set themselves a schedule. Yet the ordinary sidecar driver has difficulty in averaging 20 m.p.h. between two towns at comparatively short distances apart. With a solo machine a higher average than with sidecar is possible, especially when a large amount of traffic is encountered, on account of its lesser bulk.

The writer regularly drives a sidecar between two towns situated twenty miles apart, and finds that to cover the journey in the hour and at the same time drive considerately calls for a good deal of wide throttle on the open road.

During a recent trip careful observations were made to arrive at the reason why 40 m.p.h. was necessary for the major part of the journey in order to average the legal limit, and it is easy to appreciate how much time is absorbed in getting out of one town and entering the other.

On the particular trip in question, for the first half-mile several schools had to be passed at a time when the pupils were leaving. Following this a spurt was made to pick up lost time. Then came a crowded shopping centre. A tram terminus called for a drop to 5 m.p.h. for half a mile, and another half-mile stretch was through traffic, followed by a similar distance of comparatively clear road. The main road was reached by several side streets and corners. This made a total of three and a half miles covered in 21m., leaving sixteen and a half miles to do in 39m. Thirteen miles of this distance is on a good main road with two villages and a dangerous cross road, which made three half-mile sections to be traversed at not more than 15 m.p.h. average. The eleven and a half miles of open road therefore was divided into four sections, each approximately three miles long. By reference to the table which follows it will be seen that the last three and a half miles occupied 16½m., which left a balance of time for the eleven and a half miles of open road of 16½m. also. So each of the four "fast" sections of three miles (approximately) had to be covered at an average of 41.9 m.p.h. Taking into account the time required to get up to a high speed and that lost in decellerating at the end of the stretch, it will be understood that during these three-mile stretches a maximum speed of at least 45 m.p.h. is necessary. It is not every sidecar machine that can do 40 m.p.h.

	Distance.	Speeds (Average).	Time.

The unique reliability of the

Morgan Runabout

is shown by the following successes (among many others) in 1920

International Six Days — **Gold Medal**
Scottish Six Days — **Gold Medal**
English Six Days — **3 Gold Medals**

(fastest passenger machine in Hill Climb.)

Morgan Motor Co., Ltd., Malvern Link.

3-9-90.

"With regard to my three hours' ride at Brooklands yesterday when I put up Records in Class F, I really must say how impressed I was by the manner in which my machine stood up to the strain. Although it was raining the whole time, I did not have a single misfire, neither was there any signs of belt slip. The track was, of course, very wet, and quite nasty in parts, and yet I believe I experienced no back wheel slip at all. This I attribute to the spring frame. Considering the bad conditions my ride was a very comfortable one. I must say I consider that your spring frame is ideal for speed work. It is a pity the weather became ultimately too bad for me to continue, as it would have been so interesting to see how long I could have kept going at that speed and with the engine working against such a colossal load."
M. G. Breeze (Capt.).

YOU NEED A SPRING FRAME!

¶ You cannot thoroughly enjoy motor cycling, you cannot get the service you ought from your mount unless it has a spring frame. The

COULSON-B

stands out from all motor cycles in being perfectly sprung—its suspension, with its equal distribution front andrear and both sides of the machine is that of a car, and gives the same full measure of protection from road shocks. With the Coulson spring frame you may ride with pleasure and impunity in conditions that with a rigid mount would be out of the question.

LATEST COULSON-B SUCCESS.

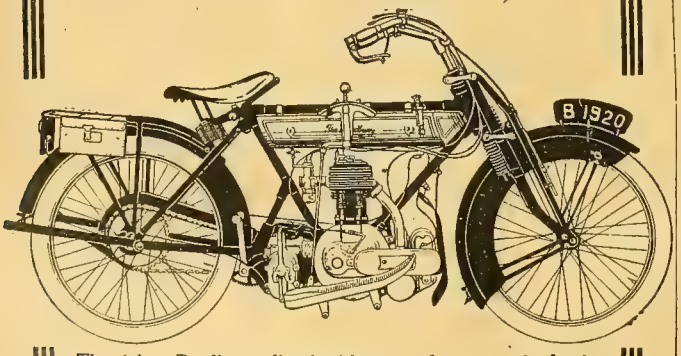
The Bradbury

The Machine par EXCELLENCE for HILL CLIMBING and RELIABILITY.

Read the Testimony of a rider of the Bradbury :-

Mr. E. W. Aldridge, 91, Queen Victoria St., London, E.C., writes :-

"About 6 months ago I bought one of your 4 h.p. machines fitted with a heavy side car. Have done about 3,000 miles always with a load of 4 up—average weight 30 stone exclusive of baggage. It hardly seems fair to tax an old 4 h.p. engine with this load, but, never the less I have not once been stuck on any hill in the South, and, in fact, I am so pleased with the outfit that the lot has been taken down to be thoroughly overhauled and re-enamelled. It might interest you to know that on examination of the engine there is *practically no* trace of wear. I have ridden two brand-new outfits but they do not come up to this old 'Bradbury' for hill climbing and reliability—it never goes wrong."



The 4 h.p. Bradbury, fitted with 3 speed gear, cork clutch kick-starter, and chain drive.

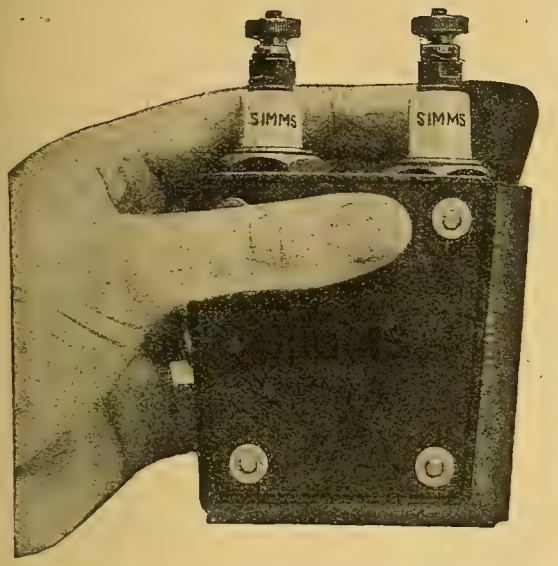
EVERYTHING FOR THE MOTOR CYCLIST

359-361, Euston Road, London, N.W.1
GLASGOW .. .. 72, St. Vincent Street

Yours for the asking!



A LEATHER PLUG CASE FREE OF CHARGE.

YOU can obtain this fine leather plug case, free of charge, providing you purchase two Simms "Non-Soot" Plugs. A couple of good plugs costs 10/- in any circumstances, but if you buy Simms (and you cannot do better) you also get a strong pigskin case in which to keep them. You will find this case protects your plugs from injury. There will be no more cracked insulators; no more bent contacts. And it is yours, gratis. But you must place your order quickly, as the number available is limited.

If your dealer cannot supply from stock, write direct, stating if plugs are to have single or twin points, and Metric or American threads, and post to us with remittance.

PRICE:
Case complete with 2 Simms "Non-Soot" Plugs, **10/-.** Obtainable from all good dealers.

TRIUMPH, 1920 model, in stock, £127/10; al Triumph renovated model, £105; makers' fi price; half down and 11 payments.—Lamb's, 3 Euston Rd., London, N.W. 151, High St., Walthar stow; and 50, High Rd., Wood Green, N. [41

1920 (June) Triumph Combination, condition new, tyres unpunctured, only done 500 mil Swan sidecar, accessories over £12, exceptional smart outfit, guaranteed perfect; £140, with insu ance.—Sturgess, 47, Cecil Rd., Erdington, Birminghar [43

TRIUMPH Gloria 4h.p. Combination, 1920 deliver engine No. 66758, excellent condition inside a out, all lamps, screen, tools, new spare cover and tub an absolutely reliable outfit, will drive up to 150 mil to purchaser upon receipt of cash; £145.—Keen, Bro St., Leominster. [40

1919 Triumph, solo, wonderful model, guarante perfect, 3-speed countershaft, low mileage, sprin pillion, open exhaust or otherwise, horn, tools, et spares, 2 new tyres, 2 tubes, 2 belts, valve, chain, plu barrel spring, waterproof suit, helmet, etc., insuran July; £95; owner going abroad; seen after 6.—War 99, Wardour St., W.1. [40

WAUCHOPE'S, 9, Shoe Lane, London, E.C.4. New 1920 4h.p. Triumph, delivery from stoc £127/10 solo; can be fitted with Gloria or any oth make of sidecar immediately from stock; also new 192 4h.p. Triumph combination, all-chain drive, £195; an 4h.p. W.D. renovated Triumph and sidecar, renovate 1920 by Triumph Cycle Co., £120. [43

TRIUMPH 3½h.p., clutch, new parts fitted, pisto complete, steering column, crank pin, bushe clutch and rear wheel rebuilt at Triumph work recently, tyres Dunlop heavy and Hutchinson T.T. practically new, wide bars, Pedley grips, fast machine large P.H. head lamp if required; £50.—R. Shelto Cookhill, Alcester, Warwickshire. [46

Tyler.

2¾h.p. Tyler T.D.C. 2-stroke, 1920, Amac, U.I mag., excellent running order, just overhaule £36, or nearest; seen by appointment.—Symmon Copford, Colchester. [38

Velocette.

VELOCETTE.—In stock, 1920 2¼h.p., 2 speed £75.—Parker's, Bradshawgate, Bolton. [X45

CYRIL WILLIAMS, for early delivery of Velocett —Chapel Ash Depot, Wolverhampton. [22

THE MOTOR CYCLE
ESTABLISHED IN 1903
AND FOR OVER SIX YEARS THE ONLY PAPER SOLELY DEVOTED TO THE PASTIME

Advertising and Publishing Offices: 20, Tudor St., London, E.C.4. *Editorial Offices:* Hertford St., Coventry.

Road Signals.

A DEPARTMENTAL Committee has recommended that the adoption of a uniform code of road signals shall be made compulsory. In some quarters it has been suggested that such a measure might not be desirable either from the public's or the motorist's point of view.

There is not a motor cyclist or car owner who does not agree that the question of road safety should take precedence over all others, but opinion is divided as to whether the suggested code of signals should be made compulsory or voluntary. The Motor Legislation Committee is in favour of the latter, for which there is much to be said. This Committee is of the opinion that a system of voluntary signalling, with Government authority and recommendation behind it, would add new safeguards to the old ones, while an obligatory system would substitute a new code for that existing at present.

What is more important, however, is the fact that a compulsory signals code will create a new class of punishable offence. There are quite enough regulations concerning owning and driving motor vehicles without the addition of a compulsory signals code, in which connection it must always be remembered that the chief reason motor cycles have not been used very extensively in Germany has been the regulations which have always strangled the industry.

The Legislation Committee considers, if these new proposals were made compulsory, drivers would be looking for signals instead of taking care to avoid possible causes of accident, and if, for any reason, the requisite signal was not forthcoming, accidents might happen which otherwise would be avoided. The views of our readers in this matter would be of interest.

Under existing conditions the signals which have become customary with motor drivers are almost unfailingly used by them when circumstances require; the greatest neglect of them is shown by drivers of horse-drawn traffic.

The Vital Fuel Question.

IT is with great satisfaction that we note the energetic campaign which is being carried on in order to produce and increase the fuel supply for road transport in this country. Our readers are well aware that *The Motor Cycle* and its sister journal, *The Autocar*, have long realised the vital importance of this subject, and have constantly urged the Government to pay more attention to the question. One of the latest developments takes the form of a series of lectures organised by the Empire Motor Fuel Committee, and read before the Imperial Motor Transport Conference held at Olympia during the present week. These lectures deal with the whole question in a most comprehensive manner, and include details relating to the manufacture of producer gas, benzole, shale oil, and alcohol, and also with distribution, denaturing, and Excise difficulties. The new Finance Act will provide greater possibilities for the introduction of alcohol as a power producer, and a real effort is being made to produce a workable scheme for the production and distribution of this fuel in a form to comply with Government requirements.

In the meantime it is interesting to study the results which have already been obtained with alcohol both on the road and on the test bench. A most useful series of experiments has been carried out by the London General Omnibus Co. under the direction of Mr. Shave (the company's chief engineer), by which it was proved that in summer at any rate a 5% alcohol-benzole mixture gave excellent results in a high-compression engine. With an addition of a small percentage of ether a much higher percentage of alcohol was found to be practicable, but the question of heating the mixture is of considerable importance. The L.G.O. have done much pioneer work, for which all motorists and motor cyclists should be duly grateful, and their bench tests, which have been carried out under most careful supervision, are backed by extensive road tests.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Foot-operated Gear Changes.

SEVERAL ex-despatch riders write to say that, though I was correct in signalling out the Scott as the only standard foot-change, they consider the foot-operation of the W.D. Sturmey Archer Triumph the nicest change they have ever known, and regret that the modern edition of that gear box is designed for operation by a frame lever.

Misfiring on Two-strokes.

"CHINOOK" is well able to defend himself against "B3972," or any other critic, but I shall enter the lists, as this champion of the two-stroke makes a little incidental dig at me. If some firm brought a libel action against "Chinook" and myself for what we have written about two-strokes, methinks the judge would sum up somewhat as follows:

1. Most two-strokes misfire at low engine speeds.
2. Most two-strokes misfire at high engine speeds under light load (*e.g.*, downhill).
3. The fuel consumption of two-strokes varies from the sublime to the ridiculous on different makes according to (*inter alia*) their port design.
4. A clever rider gets far better results from two-strokes than a duffer.

I fancy most two-stroke enthusiasts with a varied experience of several makes would endorse these conclusions. Not long ago a member of the Scott staff said to me, "Our new customers either sell the machine within six months, or remain Scott enthusiasts for ever." The *clou* of the two-stroke surely is that it takes a little sympathy and knowledge to get the best out of it, whereas any fool can suck joy out of the average four-stroke.

Mysterious Accidents.

IS it any good dogmatising about the causation of such mysterious accidents as befell Mr. Boyce? A medical man after examination might be able to arrive at the exact cause in any particular case. If the rider is in such perfect health that a faint or an attack of vertigo may be ruled out, it is always possible that a knock on the head will produce forgetfulness of the incidents which led up to the smash. I was once riding with an athlete, when he looked over his shoulder, ran over a big stone, got a wobble on, came off, and bumped his head on the road. When he came round, he remembered nothing whatever of the preliminaries, and was very angry with me for not providing some better justification of his accident. One of Baum Father's "Fragments" summed up a push in France under three spasms on some such lines. A rider who took a bad toss as the result of a speed wobble might easily find his mind a blank as to the wobble, and imagine he had fainted in the saddle. My own experiences of this kind have all ended just short of disaster, and have been uniformly due to falling asleep on long rides.

An Indispensable Gadget.

IT is a marvel to me that so many night riders venture abroad without a reserve supply of carbide, especially when the accessory merchants supply neat little canisters in suitable holsters. On a recent night, for example, I was out as passenger on a big sidecar outfit, and the American generators turned sulky; sometimes we had a head light, sometimes a side light, sometimes a tail lamp, but never all three simultaneously. The distance concerned was short, and, rightly or wrongly, my skipper preferred to chance the police rather than open up his generators, and, finding the whole charge sodden, risk the rest of the trip without even the odd chance of a glimmer somewhere. Mercifully, a night mist descended, and if any bobbies were out on such an inclement night they probably failed to identify us; but a half-pound reserve would have sent us on our way in safety.

Bigger Tyres for 500 c.c. Outfits.

THERE is a slight but laudable tendency in the trade to divorce the 500 c.c. solo mount from the 500 c.c. sidecar mount, and so to relieve the solo man from the extra weight, etc., of the machine which is avowedly built as a dual purpose mount. I think the firms who intend to proceed on these lines might make their sidecar model even a little heavier than the existing two-in-one machine. During the past summer I have heard very bitter complaints from commercial users of the 500 c.c. sidecar outfit on the score of tyre costs. Here and there one meets a man who gets extraordinary mileages from 2½in. covers on the driving wheel of a 3½ h.p. sidecar. But the majority of these outfits seem to be undertyred. I don't drive such a fit-up myself, so I must not dogmatise; but there are a lot of owners who do not get 2,000 miles out of their back covers under such conditions. It is probable that the substitution of a 3in. driving tyre would be a real economy wherever such outfits are used on rough roads in hilly districts. Moreover, a maximum tyre life of 1,500-2,000 miles implies undue frequency in punctures, with the consequence of roadside delays which are serious if the machine is used for business purposes. I should like to see many existing 500 c.c. machines produced in two editions for 1921—viz., a solo model, 100 lb. lighter than the 1920 pattern, and a sidecar model which might justifiably be a little heavier than this year's type.

Oiling up Plugs.

SOME of my correspondence suggests that the average novice feels he is between the devil and the deep sea on his early rides. He knows that a new engine requires lots of oil, but if he keeps on the safe side in this respect, he fouls his sparking plug. Riders and books treat an oiled plug as the merest trifle, but a new plug costs a dollar, many riders are quite impecunious, and many plugs cannot be cleansed when once they are crusted over with charred oil. Perhaps the following tip may help some beginners. Motor cycle lubrication makes great demands on the rider. With every unfamiliar engine you have to study the oiling much as a golfer studies a three-yard putt. Until you have acquired the necessary precision, you will probably oil up a plug or two. When once you have learnt how to oil (*a*) when touring; (*b*) when scrapping; (*c*) on a freak hill, you will be able to keep your plugs clean. During the preliminary period there is only one kind of plug which you can afford to use, viz., the plug which takes to pieces for cleaning. Armed with a couple of these plugs you can over-oil to your heart's content; the sole penalty will be an occasional change of plug on the road, and half an hour at home that evening spent in dismantling and scraping down the two plugs. In the course of a month or so the engine will be nicely run in, and you will have mastered the lubrication. If you then elect to switch over to a non-dismountable type of plug, well and good. It may be that some cemented plugs are less liable to overheat or to soot up than the dismountable patterns—most riders have their fads in this sphere. But the novice's first plug, if only for reasons of economy, should certainly take to bits for home cleaning.

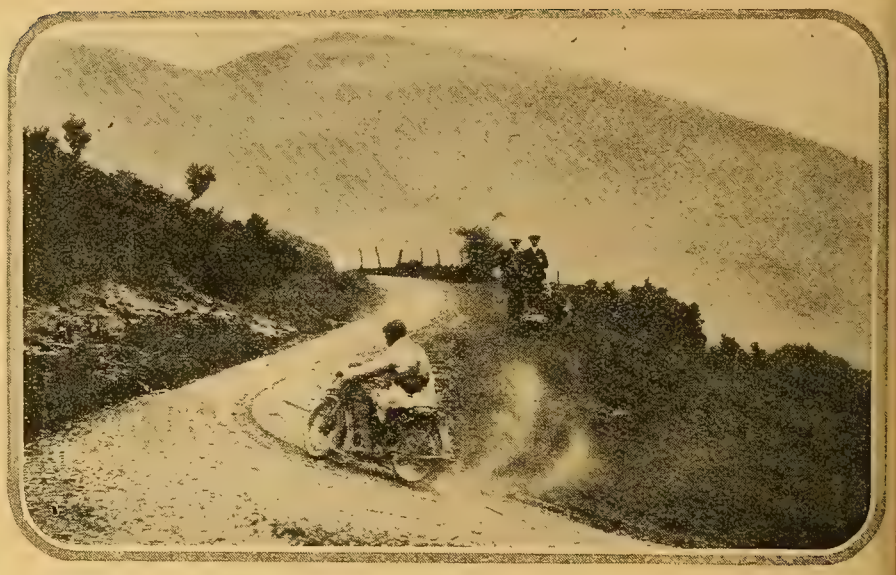
Yet Again.

IS it too late to appeal to the tyre and rubber people for a waterproof glove this winter? I will be absolutely outspoken. I have ridden hard for twenty winters, and have only owned one glove which was perfectly satisfactory in winter use—the rubber-proofed Continental, which, of course, was pure Hun. I never used anything else in pre-war days. My last pair are now tattered to a degree, and must go to the scrap-heap very soon. I have a variety of substitutes, none of them satisfactory. Either they are not genuinely drencherproof, or they are cold, or they are so thick and stiff that I cannot twiddle my levers comfortably. The Continental was as dry as a bone internally after six hours in a snowstorm. It was so thin and light that the levers were just as manageable as when one rode with bare hands in summer. It was unventilated, and kept one's hands warm. If any rubber firm wants to make money, let it study this glove, and see what it can do. Car owners will buy it as greedily as motor cyclists, for the wet blows in through an opened screen as well as across naked handle-bars. Unless somebody comes to my rescue, I must tackle this winter on three pairs of leather gloves discarding each pair in turn as it gets sodden.

EASY GOING.

A "good road" section in the recent trial in Wales. The average member of the community only sees competitors on such good roads as these, and little realises that often the riders have just descended from miles of rough mountain tracks with "surfaces" unimagined by all who have not seen them. Above are depicted P. Pike (2¾ O.K., No. 19) and R. C. Bennett (2¾ Federation, No. 13) on the side of Bala Lake.

TRIALS for MAN or MACHINE—WHICH?



The Present-day Trial Discussed from the View-points of the Competitor, the Makers, the Organiser and the Public.

DO present-day trials create an erroneous impression, regarding modern motor cycles, in the mind of the potential buyer?

Can they be regarded as good propaganda?

Do they prove anything of value?

Do they improve "the breed" of motor cycles?

These four questions are at present exercising the minds of many motor cyclists, and, at the conclusion of the recent Welsh Trial, described in last week's issue, there appeared to be a decided tendency to regard such events as absurd and damaging to the pastime of motor cycling.

We propose to discuss this matter from various viewpoints, and, first, will take that of the competitors, who may be divided into two classes—private owner and trade.

The Private Owner Competitor.

The first is usually an enthusiastic rider who regards all trials as so much sport. Trials riding *is* good sport, and it brings a man in touch with the coterie of experts whose names become well known to all who read *The Motor Cycle*. This class of rider is very keen; keen to show his skill and the power and reliability of his machine, and keen to gain credit. After his first trial, the newcomer to the competitions field is able to realise the difficulties of winning a "gold" which are not always appreciated by the ordinary motor cycling public.

No doubt if a census of opinion were taken of all private competitions riders, the general opinion would be that trials courses could not be made too severe. This does not mean that the private owner agrees with conditions being made more difficult, and there is probably not a competitor in the Welsh Trial of October 9th who will not agree that it was the conditions, and not the course, that gave cause for complaint. The private owner, like every other sportsman, likes a run for his money, and this, in the M.C. and A.C. Trial, he did not get, for Alty Bady was within a mile of the start, and after this first mile only nine were left in the trial to qualify for gold medals. The loss of even one mark was sufficient to rob a man of his "gold," and on such a course the penalty was too severe, especially as a man had but to touch the ground with his feet to be penalised.

The Trade Rider.

From a sporting point of view the trade rider is just as keen as the private owner, but he is in a very different position. He is out to get a "gold" for his firm, the principals of which do not always realise the difficulties and hardships; consequently, to return home with, say, a second or a third-class award is the last thing he desires. It is like a commercial traveller returning with an empty order book.

Again, it is the regulations and not the route which cause dissatisfaction. The trade riders—the experts of this country—know better than anyone else that the modern motor cycle will take its load up any hill where wheel grip can be obtained. The makers know this themselves, and consequently, when their rider returns without a first-class award, though a more lucky competitor may have succeeded, wonder whether it is the man and not the machine that is at fault—whereas actually it is neither.

The Makers' Viewpoint.

Neither class of rider is much concerned whether his success or failure has any influence upon developing the motor cycle or upon the opinion of the public. It is for the trade and the governing body of the movement—the A.C.U.—to decide whether the strenuous trial over mountain tracks is of any value whether as general propaganda, in the interests of design and durability, or as advertisement.

The makers of motor cycles are in the industry to make money, and they appreciate that to do this they must produce a good article, prove that it is a good article, and advertise that proof. Also, they realise that in order to find an outlet to large outputs it may be necessary to advertise motor cycling as well as moto

Trials for Man or Machine—Which?—

cycles. In other words, propaganda is desirable to interest the non-motoring public in the motor cycle as the most economical means of mechanical transportation, and as a vehicle which is reliable and easy to understand.

Do these so-called reliability trials prove reliability, and does failure to win a first-class award prove unreliability?

The makers are coming to the conclusion that the awards do not prove anything of value to themselves or to the buying public, because awards are decided on points not connected with reliability.

The Organiser's Difficulties.

We will now take the viewpoint of the trials organiser. Generally he has to plan a trial to find a single winner for some valuable trophy. He must make an honest attempt to give every competitor—irrespective of the type or power of machine—an equal chance. Since most machines are entirely reliable, he has to devise a means, outside the question of reliability, in order to make one performance appear better than the others. Naturally, for a competitor to win a much desired trophy is a greater honour than to be one of several gold medal winners. Yet the trophy winner may not prove his machine to be any more reliable.

The secret check, which places undue value upon the personal factor, is no longer popular, and this year special tests have been introduced in order to arrive at a decision. These tests have included many features of interest, but are often far from picking out the most meritorious general performance of machine.

Trials' organisers plan their events on the assumption that too many gold medals reduce their value. This is a point very much open to debate.

Always bearing in mind the question of reliability, one is constrained to wonder why, if all the competitors can do *everything* to prove reliability, they should not all have gold medals.

As the recent M.C. and A.C. Trial has revived the question as to whether it is "worth while," we will take this event as an example. Gold medals were offered to all scoring full marks (no bonus marks were given), silver medallists had to secure 90% of the marks. There were no bronze medals. In addition, there were several trophies and special "class" prizes.

The following is a list of the penalties subdivided by us under three headings, *i.e.*, (1) those that have bearing upon reliability as understood by the man in the street, (2) those that have not, and (3) hill-climbing.

1.—RELIABILITY FACTORS.

Failure to start engine within 10 secs., 3 marks.

Brake Test: Failure to stop within 9ft. on a steep hill after traversing 73⅓ yards at 10 m.p.h., 3 marks (more marks are lost if the conditions are not observed both as regards time and distance).

Stop and Restart Test: Failure, 5 marks; running back over tape, 10 marks; stopping in a non-stop section, 10 marks.

According to the route card, it was a non-stop trial, excepting for the luncheon interval.

2.—SOME OTHER PENALTIES.

Going off the course, 20 marks; footing or running into a bank on a hill, 10 marks; for being more than 10 mins. ahead of time, 10 marks; passenger assisting driver on test hills by putting extra weight on the carrier, 10 marks.

3.—HILL-CLIMBING.

For Failures on Hills: Alt-y-Bady, 10 marks; Gough's Conscience, 5 marks; Whitworth's Grave, 5 marks; Boydell's Playground, 10 marks; Urry's Pet, 5 marks; Cross Foxes, 10 marks; Bwlch-y-Groes, 10 marks.

Scenes like this are regarded as damaging to the motor cycle movement because the general public cannot obtain a true impression of the conditions. Even the best of photographs cannot show the gradient, or convey an idea of the difficulties immediately preceding the *pièce de résistance*. The lower picture shows an incident on Gough's Conscience in the M.C. and A.C. Trial. Both riders lose the same number of marks. Above: L. Crisp (4½ Humber) forfeits his "gold" on the same hill, though he did not stop.

Trials for Man or Machine—Which?—

To touch the ground with the feet was accounted a failure, and all this was clear in the regulations. Intending entrants should have known that Alt-y-Bady is usually climbed by about 10% of the soloists only, and in the September trial of the Liverpool Club not one sidecar made a clean ascent. From the regulations it was seen that Alt-y-Bady was not the worst hill, as three others were considered to be bad enough for a loss of five marks only in the event of a failure as against ten for the Llangollen Hill.

It was plain that the organisers had planned a knock-out trial; anyone who had studied the rules could see that there was next to no chance of securing a gold medal.

Alt-y-Bady, the first hill, is in the same category as the Nailsworth Ladder in Gloucestershire, which, incidentally, has many times been climbed by cars and motor cycles, but no trials organiser has had the temerity to include it in a trial. We have yet to hear of a car climbing Alt-y-Bady, yet competitors were not only required to climb it (and over thirty reached the top without stopping their wheels), but were called on to do so without touching the ground with their feet.

Trick Riding v. Reliability Trials.

The public look upon cars as having reached a stage when reliability trials are no longer necessary. From the number of so-called reliability trials organised in this country, an impression must be created that motor cycles have not yet been proved so reliable.

Competent critics know that motor cycles have reached the same stage. That is the reason why it is necessary (?) to reduce the number of likely winners by regulations which turn so-called reliability trials into tests for ultra-expert riders on machines particularly adapted for trick riding.

Gough's Conscience and Whitworth's Grave were muddy lanes up the sides of the mountains. To expect any rider to negotiate them without touching the ground with his foot was unreasonable.

The inclusion of the Eunant Pass or Boydell's Playground, as it was called, was justified. It was no worse than some of the hills in the A.C.U. Six Days of this and last year. Urry's Pet was a stone staircase on which touching with the feet was permitted, but it was a freak hill of the worst kind, and one which should not have been included.

It will be seen from the above that a man had but to touch ground once on the whole of the course to lose his "gold." As it was a "reliability trial," it is very much open to question whether such conditions should be made.

A Few Concrete Examples.

Among the many competitors who did very well in this trial, we will take as an example W. Brandish, junr., who rode a standard 4½ h.p. Humber. He "touched" once on Alt-y-Bady, and once on the slime of Gough's Conscience. If the rules of the trial are adhered to (these notes are written before a final decision on this point has been made), he will be awarded neither a gold nor a silver medal, and, unless he has made the best performance in his class, he will have no award of any kind. Is it fair to the rider, to the maker of the machine, and to that section of the public who are guided in the choice of a new mount by competitions' results? We say—No!

Again, another competitor, P. Pike, on a 2¾ h.p. O.K., completed the course to time without leaving the saddle and without being assisted, but he "touched" several times.

It is the system of marking that is wrong. Utterly to fail on a hill was accounted equally bad as to touch the ground with the toe of a boot. To fail on Cross Foxes only meant a loss of ten marks—a plain straightforward top gear hill for the majority of machines, and one which we covered on second and top gear with a heavy sidecar. We maintain that every rider who finished the course to time and without actually stopping his road wheels is entitled to some recognition of his performance. As a sporting trial, the event under discussion was one of the best that has been organised.

The Motor Cyclist's View.

It is thought by members of the trade that the results of this trial will give an entirely wrong impression to the public as to the merits of the various machines. Incidentally, it is strange that there was a greater trade element at the back of the M.C. and A.C. trial than any other event held this year. To judge whether such trials do give a bad impression, it is perhaps desirable to take each section of the public separately. Well over 100,000 motor cyclists read *The Motor Cycle*, and from its pages can obtain a true perspective of the merit of performances. From our last week's report of the trial, we do not think anyone of our readers can be misled into believing that present-day motor cycles are anything but a marvellous piece of mechanism to have finished the trial with such a small number of retirements.

Propaganda in the Future.

The rest of the public consists of over forty million people, one million of whom may be potential buyers. It is to this section of the community that the knock-out trial may possibly create a wrong impression. They see motor cyclists hurrying along the roads with numbers on their backs and generally think that it is a race. A few perhaps obtain information that such and such a machine failed to get an award, and undoubtedly they are left with the impression that it is not so good as another which has been awarded a medal.

In some quarters it is considered desirable to institute propaganda to popularise motor cycling, and for that reason it is thought that trials should be known as sporting events—tests for men and not for machines. Every week there are so-called reliability trials, and the newspaper reading public must get the impression that motor cycles have yet a long way to go before they reach the same stage of perfection as cars.

Competitions are needed to demonstrate how reliable are motor cycles, and not how few can secure awards. Improving the breed is quite all right in its way, but it should be left to the A.C.U. Six Days event.

Certainly it is impossible to find a single winner for a trophy on points of reliability alone, but the time may come very shortly when manufacturers will refuse to support events in which are included special tests which have nothing to do with reliability.

The Light Weight "3½."

A Word for the Simple Solo Single of the Type made a Decade Ago, and which weighed under 190 lb.

THE idea, now so prevalent, that a solo motor cycle to be effective must be equipped with a three-speed gear, chain drive, and other costly and heavy refinements, is to a great extent fallacious. The simplicity and briskness of a single-cylinder 500 c.c. machine will be found to compensate to a large degree for the lack of a kick-starter and gear box. Certainly an automatic pulley may be fitted to advantage, because it in no way deprives the T.T. motor cycle of its best characteristics, and it eases the engine just when necessary. Experience proved that with such a pulley there was no trouble from belt-slip or excessive wear on belts; in fact, it eases the belt from snatch when the engine is "plugging," and also when it is violently accelerated.

Achievements of a 1912 Model.

In the autumn of 1912, the writer purchased a 3½ h.p. T.T. Premier, fitted with a drilled pulley. Drilled engine pulleys are a constant source of belt-slip, and for serious motor cycling they can be classed with discs as being undesirable. This machine was improved by the substitution of a Philipson pulley, and at the United Services meeting, held on the Brooklands Track in September, 1915 (the machine then being three years old, and, in spite of at least 20,000 miles to its credit, as good as the day it left the Premier Works), it easily won a heat, and almost secured a place in the 600 c.c. Open Sprint, and, *without any adjustment to the pulley*, tied equal *first* in the 600 c.c. Open Test Hill-climb. The weight, stripped, on this occasion was only 156 lb., and the machine as used for touring scaled under 190 lb., with lamps and spares. The carburetter used was a Senspray, which the writer considers to be well adapted to this type of motor cycle. No mechanical trouble was experienced, although the Premier was not specially nursed; but always care was taken, first, not to race the engine until it had warmed up to its work, and secondly, to see that the valves were down on their seatings when a ride was ended; both of which simple rules ensure even expansion or contraction, and make a great difference in preserving the tune of the engine.

Reliability and Liveliness.

For comfort and reliability no less than for high average speed the writer can recommend such a machine, which, with lamps and horn, should not cost more than 70% of the heavy tourist or sidecar medium powered motor cycle.

A valve cap decompressor was found useful during a sojourn in the Metropolis, but for ordinary country use this was discarded. The average consumption was 80 m.p.g. with petrol, and the only time benzole was tried 120 m.p.g. was obtained on easy, but muddy, roads. Twice, through running out of petrol, neat paraffin was requisitioned, and the journey home was completed, but (in common with the writer's experience on other machines) the carburetter insisted on less, and not more, air. As to "speed wobble," a slight "dither" of the rear wheel was noticeable at high speeds, but this in no way affected the control of the machine, as there was never any tendency for the rear wheel to swing right out of track, and one soon became accustomed to it. The wide, low footrests, rigidly supported behind the crank case, helped to steady the cycle, especially on corners, which were taken by leaning the machine well inwards, with as much pressure as was possible on the outside footrest.

The writer on his 1912 3½ h.p. T.T. Premier.

Previous to this the writer's last two machines were a 7-9 h.p. American twin and a 3½ h.p. machine of the same make as the T.T. cycle, but fitted with a Sturmey-Archer hub gear and weighing 230 lb. Neither of the latter was as fast nor as handy as the T.T. machine, and most active riders would have preferred the simpler type for anything except traffic dodging.

Faith in the Single Cylinder.

At present the writer has an I.O.M. pattern 3½ h.p. Rudge-Multi which seems to combine all the best qualities of the purely sporting mount with a capital variable gear and a clutch. The power unit, too, confirms one's belief that the sturdy single of first-class design will more than hold its own with twin or multi-cylindered engines of various patterns.

It must, of course, be understood that personal taste will create a market for almost every type of motor cycle that is known, and that the writer in no way intends to trumpet an overwhelming superiority on behalf of the single-cylinder machine or of the T.T. type. One's own machine may indeed be "another man's poison," but therein lies much of the interest to be had in the progress of the modern motor cycle. In any case, the present-day enthusiast need not fear to plunge for, say, a Norton, Rover, or similar T.T. machine—the Premier is no longer made—if he considers that the price of a more elaborately furnished machine with gears, clutch, and kick starter, is beyond him. His personal inclinations and needs can be reconciled with probably a number of the many excellent machines now being manufactured. VELOX.

THE DOUBLE-PURPOSE 3½ h.p. SINGLE-CYLINDER COVENTRY EAGLE.

MUCH has been said, from time to time, regarding the demerits of the "single-cylinder," and for years critics have prophesied an early death to this type of engine. The same can be said of the sidecar, and yet by far the most popular passenger outfit on the road to-day is a combination of the two, namely, the dual purpose "single."

It is simple, almost foolproof, and easily handled as a solo mount. At the same time it is sufficiently powerful if suitably geared to haul a sidecar should the owner so desire. Among the well-known manufacturers who build this type of machine is the Coventry Eagle Motor and Cycle Manufacturing Co., and for some years this firm has been marketing a 3½ h.p. model on these lines.

Good Delivery Tune.

Recently we were given an opportunity of testing the 1920 Coventry Eagle on the road. The mount taken over was in no way specially prepared—in fact, it was one of several just assembled, and had not done ten miles on the road. Under these circumstances, it might be thought that a lot of tinkering would be necessary before embarking on a long run. This, however, was not the case, the only alteration being a slight slackening of the gear lever spring to allow it to move more freely.

The machine is of conventional design, incorporating well-known components, and is of pleasing appearance.

With up-turned bars and footboards, this is a comfortable touring machine. T.T. bars are an alternative fitment.

The engine is the 3½ h.p. King Dick, made by Abingdon-Ecco, Ltd., of King Dick spanner fame. It has side-by-side valves, B. and B. carburetter, and E.I.C. magneto. A short tail pipe is fitted to the silencer, finishing at the gear box. An improvement would be effected by carrying this further to the rear, as the burnt gases make the kick starter and gear box dirty. The usual chain-cum-belt transmission is used, a Sturmey-Archer three-speed gear box being fitted. The driving chain is enclosed in a substantial aluminium dustproof case.

Aluminium footboards, swept up in front, are fitted, and the rider has the choice of flat T.T. or ordinary touring bars.

Well-valanced Mudguards.

The machine in question was fitted with the latter type, and though we, personally, prefer the flat bar for solo work, the riding position was found to be very comfortable. Both front and rear mudguards are reasonably wide and well valanced, and although quite a distance was covered over very wet roads, and several water-splashes negotiated, little discomfort was experienced from mud and water.

The first 200 miles were covered principally over main roads, and, as the machine was exceedingly "new," we took things fairly easily in order to allow the engine to get properly "run in."

Later, however, quite an interesting 300 miles run was made in connection with a Western club trial,

Road Tests of New Models.—

under conditions which would rarely be encountered in ordinary touring. The course for the most part was over rough stony by-lanes in a hilly district, including a considerable amount of second gear work. The machine behaved excellently, showed no signs of overheating, and was very steady on the rough and greasy surfaces. The engine gave ample power, and on only one occasion was it necessary to use bottom gear; this was on a stiff climb of 1 in 4, where the "change down" was made in order better to negotiate the very bad surface. As regards speed, it can be said that, although no accurate test was made, the 3½ h.p. Coventry Eagle is fast enough to satisfy the average soloist. It is capable of maintaining a good average over long distances without the slightest signs of distress. This was proved on the return journey, when, being without lamps, it was found necessary to cover the last seventy-five miles in under three hours.

Perhaps a better test could have been made had a sidecar been fitted, but, judging by its performance as a solo mount, and from our observations of several we have seen in use with a sidecar, we know that it can truly be described as a dual-purpose mount.

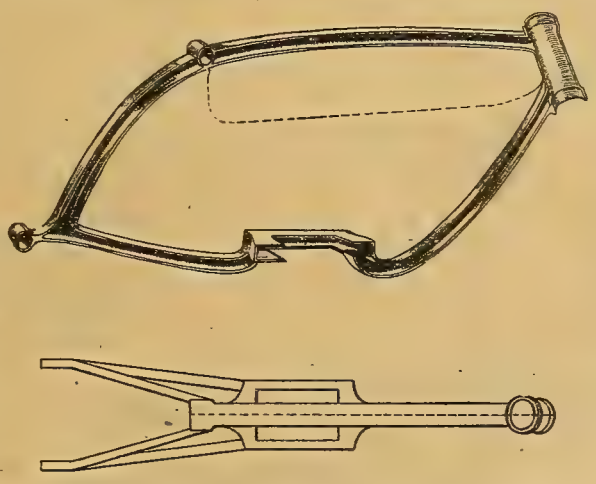
In these days of super-efficient twins riders are apt to overlook the main advantages of the single, viz., its simplicity and lower production costs, which in turn account for its inherent reliability and economy.

Stamped Steel Frames for Motor Cycles.

Pressed Steel Construction advocated from a Constructional Standpoint.

IT is curious to consider how old fashions in engineering construction cling with tenacity to the most modern workshops until, at a bound, they are abolished and some new mode set up. In this connection we have in the tubular motor cycle framework a striking example. The circular section weldless steel tube is, we know, a very tower of strength combined with light weight. But the present processes, which entail such tubes being cut to lengths and jointed carefully by brazing to lugs, leave much to be desired. In effect, the brazed tube construction is quite old, for it belongs to the pedal cycle industry, to which its use is no doubt well suited. When, however, we come to the modern mechanically-propelled road vehicle, can it be denied that the retention of the tubular frame is effete?

There seems to be little doubt that, with to-day's knowledge and wide application of pressed sheet steel, a motor cycle frame could with very considerable advantage be made in that material. And if the procedure proposed be followed, in quantity production the plan means great manufacturing economy, a stronger form of construction, much improved appearance, and lightness of weight.



A suggested form of motor cycle frame construction. The upper sketch shows one half of the pressed steel frame, and the lower a plan view of the frame completed.

The accompanying illustrations show a proposed form of stamped and welded sheet steel frame. The first figure indicates the left channeled half of the frame, in perspective, as it comes from the die, the corresponding half section being similar in every respect.

Almost any style of welding may be utilised to join the two halves together in a vertical plane, *i.e.*, there may be a lap seam, or the edges may be turned in for a V joint, or the two edges may be united in the manner familiar to the user of the now common pressed steel hollow artillery wheel. When the two halves are welded longitudinally together the cross section of the frame is rectangular, so that wherever a junction is made it is of box column formation—an admirable shape for stress resistance, as any practical engineer or architect is aware.

The lower figure is a plan view of the two stampings welded together to form the complete frame. The rear fork stays are, consequently, [section channels, integral with the frame. As to the steering head, this may be a tube welded in, but, preferably, it consists of two U sections or semi-circular integral halves of the whole.

The motor and gear seating is also a channel section, enabling the engine and gear box to be adjustable longitudinally of the frame. These organs, separately, or as a unit, may be clipped firmly, yet neatly, on the lip of their seat, thereby ensuring that chain or belt slack can be corrected without disturbance of the rear wheel axle, which, therefore, may be a fixed point.

Here, then, is a new method well worthy of employment. Strength is by no means sacrificed in any particular, while appearance is markedly improved; the elliptical or egg-shaped form is a style with which most motor cyclists would, it is suggested, be pleased. With regard to the fuel tank, it is possible so to press the sheet metal as to form the top column into a reservoir, as shown by the dotted lines in the upper figure. Such a feature has already appeared in more than one machine, but the writer thinks that no patent rights would be infringed if the enterprising members of the motor cycle manufacturing industry were to make the new style of frame so as to incorporate an integral fuel tank therewith. It should represent a large reduction in production costs.

75 M.P.H. up a 1 in 10 Gradient.

Remarkable Speeds at Revived French Hill-climb.

GAILLON hill-climb, which was revived on October 10th, after a lapse of six years, was remarkable for the records established in all classes, for the number of entries, and for the vast amount of interest evinced in it by the general public.

The fastest motor cycle time was made by Pean on a 750 c.c. Peugeot, with which he climbed the kilometre hill, flying start, in 29⅗s., or at the rate of 75½ m.p.h., this being the highest speed ever attained by a motor cycle of any kind on Gaillon Hill. In this class the Frenchman's greatest competitor was the well-known A. H. Alexander, who was defeated by 3⅕s., Pean also rode a Peugeot in the 500 c.c. class, when he again broke a record, with the time of 30⅕s., beating the Alcyon with a margin of nearly 4s. In the 350 c.c. class the Alcyon got the first two places, followed by Alexander on a Douglas, who later secured first place in the 1,000 c.c. class. Porter, on a Levis, was a fairly easy winner in the 250 c.c. class.

British Sidecar Successes.

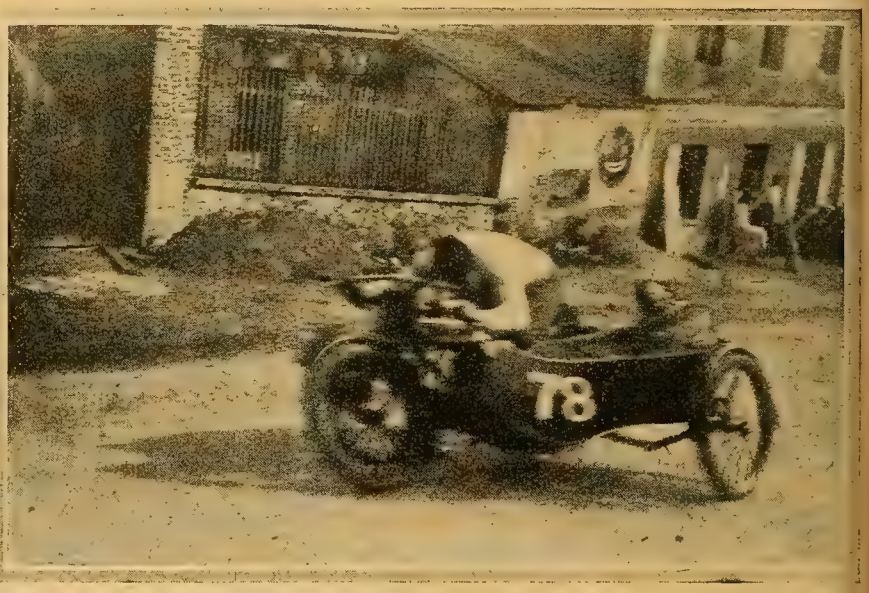
In the sidecar class, A. H. Alexander did very fine work, getting first place in the 500 c.c., 750 c.c., and 1,000 c.c. classes, his respective times being 45⅕s., 46⅗s., and 45⅖s.

The cycle car section was won in 49⅕s. by Violet, on the Major, with which he captured the cycle car Grand Prix at Le Mans only a few weeks ago. The Major was very closely pressed by an Elfe, driven by Mauve, which was only ⅖s. slower. The three Morgans which ran and secured fifth, sixth, and ninth places were French-built under licence. Darmont's Morgan had a special Mag twin-cylinder four-valve engine, but, owing to the proper size carburetter not being available, it was unable to do itself justice.

As the speeds show, it was certainly a day of records, even more for the motor cycles than the cars; for 74 m.p.h. on a 3½ h.p. machine compares more than favourably with the 108 m.p.h. record set up by the 450 h.p. Sunbeam. And, after all, in each case, the vehicle carried the driver only.

The racing, which began in the morning and continued all day, with the exception of the interval for lunch, attracted an immense number of spectators from all over the country, and was a splendid example of the growing interest of the French in motoring events. The organisation was excellent, the road being guarded by troops, and having barbed wire on each side in order to keep too-enthusiastic spectators from crowding on to the course.

The results giving the equivalent speed in miles per hour of the fastest men are appended:



A speed impression of Alexander taking his Douglas sidecar up Gaillon Hill at nearly 50 m.p.h.

The Amphibious Motor Cycle.

A Sporting Trial in the West of England includes Deep Watersplashes and Fords.

THE Bristol M.C.C. recently held a sporting trial, when twenty-eight competitors started over a course planned by E. Kickham, the well-known competition rider, who led the way.

Within two miles of the start the competitors were required to go through some 150 yards of water, which varied up to nearly 2ft. in depth. Needless to say, belt drive machines were soon in trouble. Some miles of greasy lanes led to Dundry Hill, which was taken on the run, and for the next ten miles the route was through a series of narrow farm lanes, with many small splashes, the whole being in an exceptionally greasy and rough condition.

Then came the fording of the River Chew at Chew Stoke. This splash was in some parts very deep indeed, but every one negotiated it without a tumble. Some miles of easy road led to the chief hill of the trial, known as Burledge Hill, near Widcombe in the Mendips. This hill, in dry weather, would merely furnish a stiff climb, but it proved, under the wet conditions, too much for all the competitors. Not a single machine got more than a few hundred yards up, the reason of the failures being wheel spin. The surface was atrocious—simply slime and large pebbles.

A series of stiff climbs and descents led to the finish at Limpley Stoke, where a timed hill-climb was carried out to find a winner. Results:

1, B. Newman (3½ Douglas), ⅗s. error; 2, W. W. Moore (3 A.B.C. sc.), 1s.; 3, F. Cook (3½ Sunbeam sc.), 1⅘s.; 4, E. Colmer (4 Norton sc.), 1⅗s.

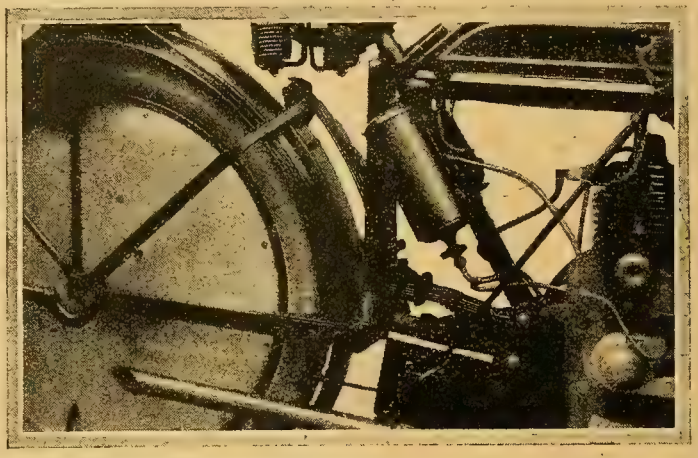
A procession of riders through the first watersplash. This is within the Bristol city boundary, and was on the day of the trial very deep in parts. Only one rider failed to get through. Norton and A.B.C. sidecars are seen preceding two Douglas solo mounts. (Left) A Zenith rider negotiating the splash. (Right) Fording the river Chew, at Chew Stoke, in the Mendips. The leading machine is a 6 h.p. Douglas sidecar.

Simple Springing

A Conversion Set embodying Leaf Springs.

ONE of the most important points which a designer of a spring frame has to consider is the lateral rigidity of the moving members of the frame. It will be quite obvious that a number of moving joints will add considerably to the difficulty of maintaining rigidity, owing to the wear of the pins and bushes.

In the Besant design, which is illustrated in an experimental form, only one articulated point is employed, this being of ample proportions—a steel pin 6½in. long by ⅜in. diameter working in bronze bushes—and having the advantage of complete protection from mud, etc., thrown up by the rear wheel. Great flexibility is obtained by the combined lengths of the two leaf springs, which are rigidly attached to an angle carrier piece pivotally connected to the bottom of the vertical frame members. One free end of the spring bears on a roller (used in preference to shackle links) on the bridge piece connecting the back stays; the other end also rests on a roller which is vertically adjustable. By this means any undue deflection of the frame, due to a heavy rider, can be corrected. This detail is not fitted to the machine illustrated, which is merely an experimental model.



A spring frame, simple in construction, which could be adapted to almost any make of machine.

The patentee, Mr. Besant, 25, Birchdale Road, Waterloo, Lancs., has decided to assist motor cyclists to fit this springing to existing machines.

A Deck-chair Sidecar.

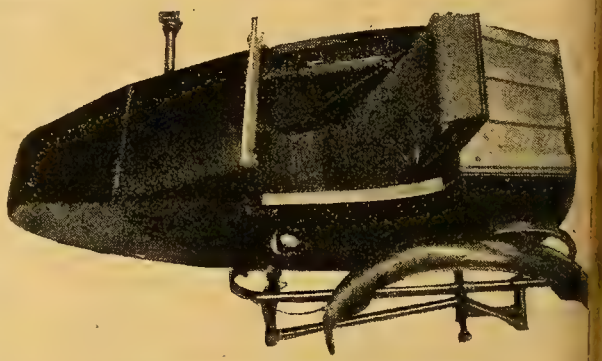
A Single or Double-seater at Will.

THE value of comfort for the sidecar passenger, especially when touring over long distances, cannot be overestimated, and the design of the seats, especially in the case of two-seater sidecars, should enable the passengers, sitting in a more or less confined space for long periods, to alter their position at will.

A sidecar with an adjustable seat and other novel features will shortly be produced by Messrs. Coppen, Allan and Co., 89, Great Portland Street, London, W.1. In it the principle of the deck-chair has been utilised to advantage.

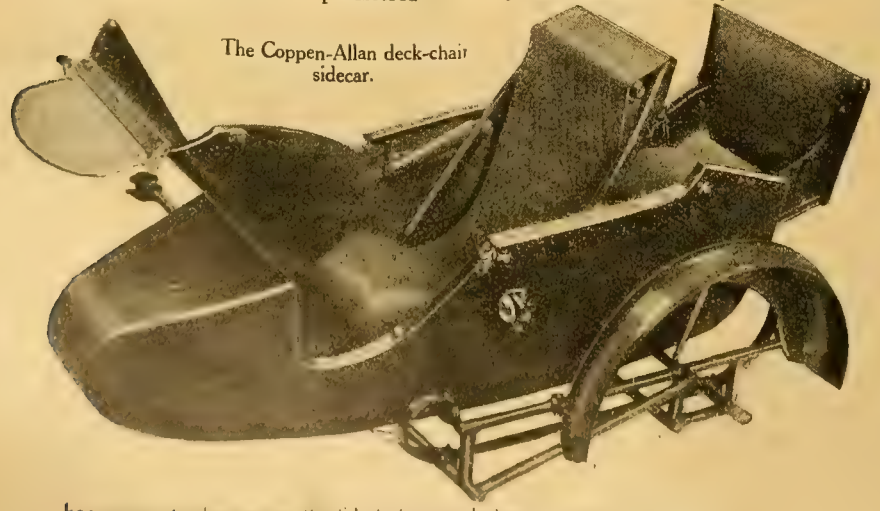
As may be seen in the illustration, the forward seat consists of an upholstered roll, suspended on a bar carried in slots in the body. The fabric extends from the roll upwards, across a spring bearer to a cross bar and is fixed to two supports, which are pivoted on the inside of the body. The back rest is held in the required position by the arm rests, which are capable of being locked. This seat can be removed entirely, or adjusted to any position. If desired, the rear seat back rest may be raised, and the front back rest lowered to its fullest extent, and a recumbent position obtained for a single passenger.

The chassis follows more nearly conventional design; and is as simple and light as is consistent with the strength called for by the two-seated body.



The Coppen-Allan sidecar as a single-seater

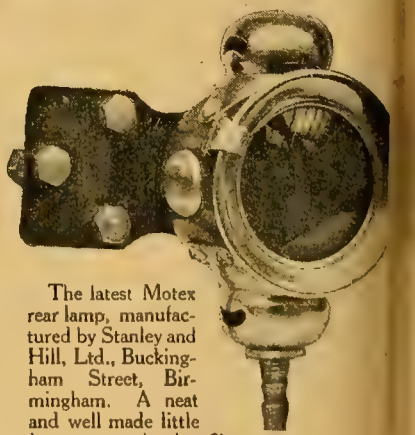
The Coppen-Allan deck-chair sidecar.



For use as a tandem seater, the lid of the rear locker is opened out Observe the door extension on the hinged dash

A NEW REAR LAMP.

It is well-known that on a rigid fram motor cycle the greatest vibration is s up on the carrier. Yet this is the on place where a rear lamp may be carrie To be satisfactory, therefore, a rear lam must be of sturdy construction, a everything else being equal, the small the lamp, the stronger it will be. T new Motex lamp illustrated is both s and strong in construction.



The latest Motex rear lamp, manufactured by Stanley and Hill, Ltd., Buckingham Street, Birmingham. A neat and well made little lamp, measuring but 3in. over al

The Rise of Pelmanism.

AN ESTABLISHED FEATURE OF MODERN LIFE.

ONE of the most remarkable features of the last few years has been the rise of Pelmanism.

Pelmanism has established a New Habit — the Habit of Mind-Training.

In the trenches we knew Pelmanism well. Every battalion had its Pelmanists by the score. And although we sometimes smile at the fervour with which they praised the "Little Grey Books," we recognised that they were good men, who were training their minds on sound lines, and doing their utmost to make the best use of their mental faculties. And succeeding.

But now that Civil Life has come, Pelmanism is making greater strides than ever.

Not only have such distinguished people as

SIR ARTHUR QUILLER COUCH,
SIR H. RIDER HAGGARD,
SIR HARRY JOHNSTON,
SIR JOHN FOSTER FRASER,
GENERAL SIR O'MOORE CREAGH, V.C.,
E. V. LUCAS,
E. F. BENSON,
ARTHUR MACHEN,
W. L. GEORGE,
and others,

written enthusiastic articles in its praise, but thousands of people in Business and the Professions are taking up Pelmanism and finding it of the utmost value in their work.

Thus a Barrister writes :—

"How very glad I am I took the Course. Every day, in an infinite number of ways, I am reminded of the advantages it has conferred. Quick memorization of facts, constant habits of observation, useful aids such as the Memory Calendar, all contribute to make life an interesting occupation, Your Course has quickened the pulse of my vitality."

And an Architect says :—

"Since I commenced your Course of Instruction, my efficiency has vastly increased. My income has gone up 300 per cent. I attribute all this to the Pelman Course."

A Clergyman adds :—

"I feel that now when I sit down to study I know how to use my mind, and that I shall remember the facts. My thinking is becoming orderly, and my memory retentive. The creation of ideas has proved invaluable. I can do my sermons better and in much less time. Also I have gained confidence in extempore delivery. My power of initiative has greatly increased."

And a Manager chimes in :—

"I doubled the turnover of my department last year. This year I am doing better than last. I am always originating new ideas, and have a vivid and well-disciplined imagination."

Thousands of such letters have been received by the Pelman Institute, and readers would be surprised if they knew the names of the people holding high and distinguished positions in the Empire who are enthusiastic Pelmanists.

The New Pelman Course.

In the New Pelman Course (particulars of which can now be obtained gratis and post free), Pelmanism has taken a further forward stride.

It has incorporated in its system the latest discoveries in Psychology, and now deals, amongst other matters, with such subjects as Psycho-Analysis, Repression and Expression, and the question of training the Sub-conscious.

The New Course is based on the experiences of over 500,000 men and women who have practised Pelmanism, and in the opinion of "Truth" it represents an advance of quite 100 per cent. on the old Pelman Course we knew so well in the Army.

Pelmanism enables you to put forth the full powers of your mind. It helps you to save waste of time and energy. It gives you the power to take on work previously beyond your capacity, and it enables you to do this work well and to "make good."

That is why Pelmanists in every profession, business, and occupation are forging rapidly ahead, trebling and quadrupling their incomes, and securing swift promotion to higher positions.

Incomes Trebled and Quadrupled.

The following brief extracts from Pelmanists' letters are cases in point :—

"During the past half-year my income has increased by over 100 per cent."—CLERK.

"Gained increase of £150 per annum."—ELECTRICAL ENGINEER.

"Secured a net increase of salary of 400 per cent."—EX-CAPTAIN.

"Delighted with my progress both monetarily and mentally."—TECHNICAL MANAGER.

"My income has gone up 300 per cent."—ARCHITECT.

"I have improved 300 per cent. in salary."—CLERK.

"I benefit to the extent of £1,000 this year."—IMPORTER.

"Since taking up the Course I have more than trebled my income."—CLERK.

"I have secured three increases of salary in five weeks."—BRANCH MANAGER.

"Thanks in a great measure to the benefits I have received from Pelmanism, my career has been an unbounded success, and I have gone on from one success to another."—CIVIL SERVANT.

"After taking up Pelmanism for about three months I was offered a very high post in the firm in which I am employed. This advancement, which incidentally doubled my salary, I attribute entirely to Pelmanism."—DEPARTMENTAL MANAGER.

Hundreds of similar cases could be quoted did space permit. More will be found in the book describing the New Pelman Course, which any reader may obtain to-day, *free of cost.*

Readers who would like to have particulars of this New Course and who want to know how Pelmanism eliminates quickly and permanently such weaknesses as :—

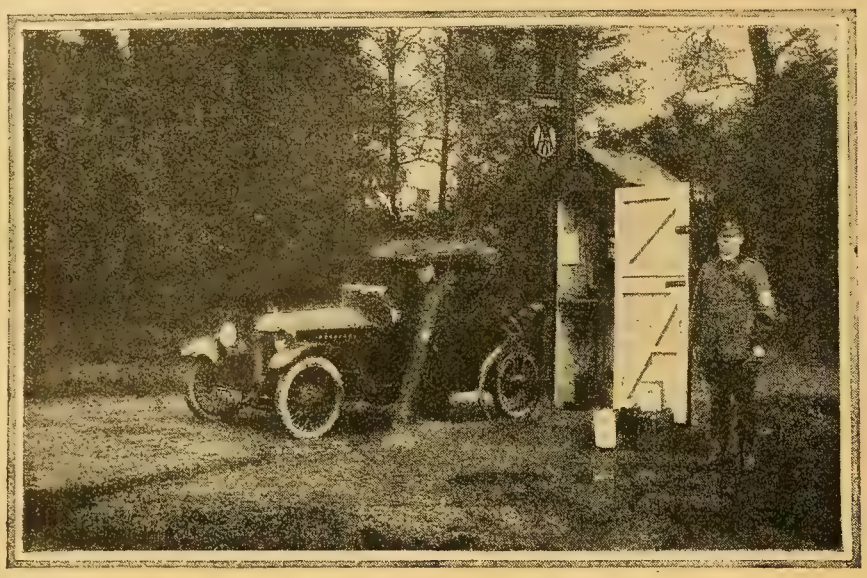
—*Forgetfulness*	—*Weakness of Will*
—*Indecision*	—*Self-Consciousness*
—*Diffidence*	—*Indefiniteness*
—*Brain-Fag*	—*Lack of Initiative*
—*Mind-Wandering*	—*Timidity*

and develops on the other hand :—

—Self-Confidence	**—Mental Grasp**
—Will-Power	**—Keener Observation**
—Clearer Ideas	**—Reliable Memory**
—Imagination	**—Zest for Work**
—Orderly Powers of Thought	**—Initiative**
	—Conversational Power
—Concentration	**—Optimism**
—Sympathy	**—Mental Strength**
—Personality	**—Persuasive Power**

should write to-day for a copy of "Mind and Memory."

This book, which fully explains the New Course, will be sent gratis, with particulars enabling readers to enrol for a Course of Pelmanism on special terms, to everyone who writes for it to-day to the Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1.



The A.A. Sentry Box at Maidenhead Thicket.

All-the-Year-Round Motoring

How to make the best use of your motor cycle during the Winter.

Every motor cyclist can run his motor cycle for fifty-two weeks in the year with the minimum of inconvenience provided he is a member of the Automobile Association.

The A A. Badge—the symbol of membership—has been described as "The modern motorist's shield and buckler, his passport and his guide." That this description is not an exaggerated one is proved by the following benefits which the badge offers.

ROAD SERVICE.

Over 20,000 miles of main road in the United Kingdom are regularly patrolled by khaki-clad A.A. patrols, all of whom are competent to undertake minor roadside adjustments, will procure replacements or motor fuel when required, and are thoroughly acquainted with all local conditions affecting road users.

ROADSIDE TELEPHONES.

These are installed in patrols' sentry boxes along the main roads and can be used by members free of charge. A special key enables any of the telephones to be used at any hour of the day or night.

MECHANICAL FIRST-AID OUTFITS.

Motor cycles fitted with sidecars, driven by expert mechanics and carrying spares and tools necessary for light repairs to cars or cycles, now work in conjunction with the roadside telephones and will respond to calls from stranded members anywhere within reach.

FREE LEGAL DEFENCE.

The Motor Car Act and Registration and Licensing Regulations bristle with technical points, but in the event of a charge being brought against an A.A. member he is defended free of charge by a solicitor in any police court in the United Kingdom.

The above are merely representative features of the Road Service offered by the Automobile Association. Other benefits of membership include: Home and Foreign Touring Facilities, Motor Fuel Stations, Engineering Advice and Assistance, Officially Appointed Agents and Repairers, A.A. Hotels, a Special Insurance Policy, etc., etc.

It is therefore to the interest of every motor cyclist to join the Automobile Association AT ONCE, if he has not already done so. As subscriptions run for twelve months from the date of joining, there is nothing to be gained by delaying the matter "until next season."

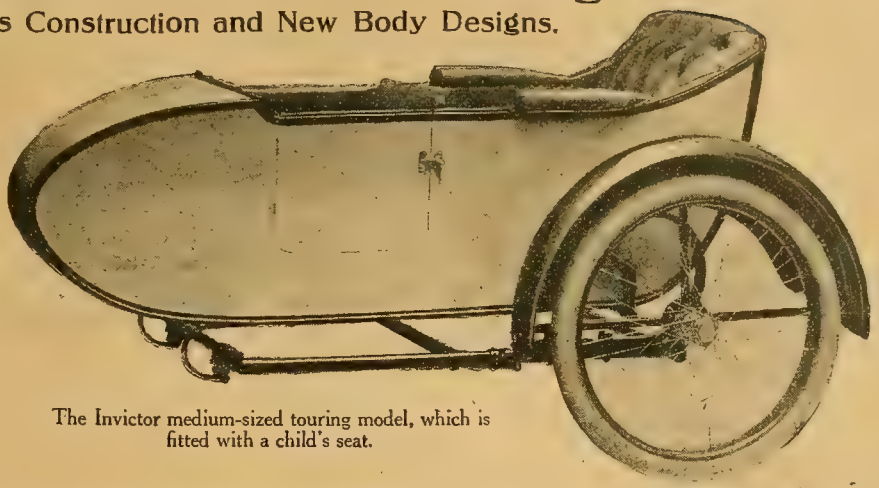
Send a postcard to-day to the Secretary, The Automobile Association, 21, Fanum House, Whitcomb Street, London, W.C.2, for a free copy of the booklet, "The Key to the Open Road," and learn how membership of the Automobile Association will benefit you.

ALWAYS AT YOUR SERVICE

In answering this advertisement it is desirable to mention "The Motor Cycle."

Developments in Sidecar Design.

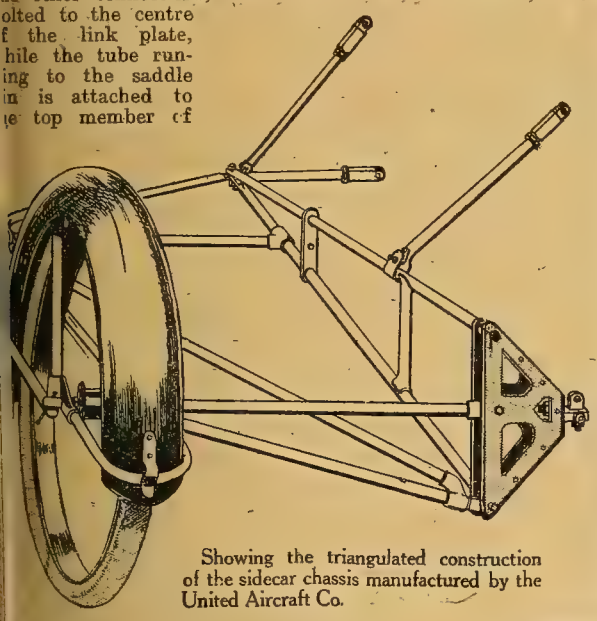
Triangulation in Chassis Construction and New Body Designs.



The Invictor medium-sized touring model, which is fitted with a child's seat.

WHEN the sidecar was first introduced "experts" said that it would have but a short life, as it was grossly unmechanical. Despite their prophecies, however, the sidecar has lived and has not only lived a long life, but prospered to an extent which, in the early days, could never have been realised. Usually designers of sidecars devote their main attentions to body design, but the United Aircraft Co., Ltd., of 4, Great Marlborough Street, W.1, have concentrated upon a chassis which has many points of interest.

In its construction there are practically no curved tubes, and, wherever possible, triangular construction has been embodied. It is attached to the machine at four points, one to the motor cycle head, the second to the down tube, which converges on to a single eye-bolt at the front end of the horizontal or "alignment" tube, as it is called, next to the machine. This tube is in duplicate, the straight members extending to the triangular steel plate also in duplicate, known as the "link" plate. As regards the other connections, the axle tube is bolted to the centre of the link plate, while the tube running to the saddle pin is attached to the top member of the alignment tube; five frame members in all converge to the front end of the alignment tube. A single tube runs from the centre of the outside horizontal member, curves over the wheel and carries it, and also forms the support for the mudguard, continuing under the axle and forming a cantilever brace for the chassis.



Showing the triangulated construction of the sidecar chassis manufactured by the United Aircraft Co.

Behind the sidecar wheel extends the sidecar wheel stand, which, when not in use, serves as an additional stay for the mudguard. A horizontal long diagonal stay runs from the forward end of the member to the bottom of the link plate, taking any weight imposed upon this corner of the frame. The members are bolted to lugs provided with eye-bolts and brazed into the tubes, while the connections of the head and down tubes consist of steel straps surrounding the tube and drawn up tight by means of tapered cotter pins, forming an exceedingly secure fixing, where security is most to be desired.

The designer of this interesting chassis is Mr. H. L. Milner (Whit. Schol.) A.M.I.C.E., who points out that amongst the many advantages claimed is the fact that many of the frame members are detachable, and for packing purposes the chassis can be reduced to a simple triangle occupying but a small space. This, of course, is an important point especially for the export trade.

At the present time these sidecars are being built for Blackburne motor cycles.

Invictor Sidecars.

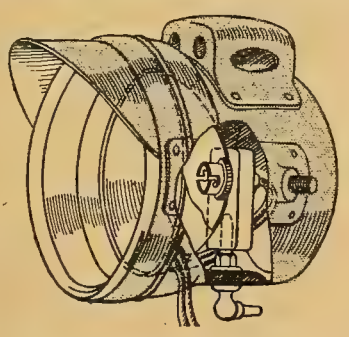
The illustration of a complete sidecar depicts one of the models of Messrs. Bryant and Hancox, of Rupert Street, Birmingham, who make three types, *i.e.*, a semi-sporting model, a tourist machine which can be used with a child's seat, and a larger model. The name chosen for these sidecars is the Invictor.

We recently inspected this firm's productions, and can say that the quality of materials used, the general workmanship, and the finish are all good. The sporting model has a side door and rear locker, and costs £22, or body only, £10; the larger model, illustrated, is £25 10s. and £11 respectively; and £30 and £14 10s. are the prices asked for the full touring model and body respectively. The makers offered the choice of several colours.

A SIMPLE LAMP CONVERSION.

QUITE a number of motor cyclists have a desire for the conveniences of electric lighting for short distances, but are loth to discard their gas lamps. For long journeys an accumulator is to be of large capacity and fully charged to give a brilliant light for several hours on end, and for this reason many prefer to retain their gas lamps, and so to adapt them that they can be fitted with either source of light.

The illustration given here shows how a gas head light may be fitted up so that the electric bulb may be quickly removed. To a small piece of hardwood two holes are drilled—one to receive the lamp holder, and the other to permit this adaptor being pushed on to the acetylene burner (this should be a fairly tight fit). The wires to the accumulator are led through the vent holes at the top of the lamp, a hole may be drilled specially for this purpose at the bottom, or they may be placed through a groove in the front, as shown in the sketch. The latter is the most convenient method, as it will be seen that the complete attachment can be removed without disconnecting the wires to the lamp holder. When fitting, it may be found that better results will be obtained by placing the adaptor so as to allow the lamp to face the existing reflector. Either way will give quite good results, but to obtain a better light a special reflector behind the lamp bulb can be used.



An acetylene head light adapted for electric lighting.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A ROADSIDE REPAIR.

Sir,—Recently, while riding over a bad road in Lancashire, I had the misfortune to break my saddle-pillar.

I repaired this temporarily, in a way which might interest your readers.

The break occurred at the lower part of the neck, so I put the top broken part in the saddle, tightened up the nuts, and forced this into the piece remaining in the frame, which I found was just a tight fit. A.

Liverpool.

FOOT GEAR CHANGE.

Sir,—With reference to "Ixion's" paragraph regarding gear change for speed and competition work, I am entirely in accord with what he says, but handle-bar control for the clutch is necessary as well. I think if he reads this year's T.T. specifications he will find that many makers fitted Sturmey-Archer gears with the operating lever fitted low down for foot operation—Norton, Blackburne, Levis, Ivy, etc. So designers, as well as riders, appreciate this type of change.

C. N. G. PHILLIPS.

CHAINS.

Sir,—With reference to "Ixion's" remarks about a naked chain which he anticipates being worn out after 2,000 miles, I think this hardly fair. I have completed over 10,000 miles on a well-known outfit with naked transmission, and have just broken my second chain, which has carried me about 6,000 miles. Also my sprocket teeth are not at all worn, and I have not experienced any inconvenience due to open transmission, which I think facilitates adjustment. From observations on the road and in the garage, chain cases and left-hand drive on a sidecar outfit are far from being most desirable. PETER.

London, N.W.

Sir,—Four months ago I was strongly of the same opinion as your correspondent "LY 1509" with regard to naked and enclosed chains. During the last four months I have covered 2,500 miles on a 3½ h.p. three-speed Norton, half this distance being with a sidecar attached. The driving chains on this machine have no protection underneath, where it is most required—a practice guaranteed to set an engineer's teeth on edge. My experience and treatment of them may not be without interest. The machine was new when I got it. The first 350 miles was covered in three days over some of the most trying roads in Kerry, and under dusty conditions. When I got back I noticed the chains had got absolutely dry, and oil and dust, a most excellent abrasive mixture, had done their work very efficiently. From a mechanical point of view, the chains were ruined. I could not leave them in this condition; they made too much noise. That they would break in the near future I had quite taken for granted. I took them off and boiled them in an evil-smelling mixture of tallow and graphite. For over three months I have not touched these chains except on one occasion to mend a puncture in the back tyre, though the machine has been on the road almost every week day. Some time ago I noticed that the rollers of the countershaft chain had turned a most alarming shade of blue, so, in an energetic moment, I repeated the boiling process.

As an ex-car owner, I may say that the major charm of a motor cycle for me is its simplicity, and I would view with uneasiness any machine where transmission design savours of car practice, especially for use under the road conditions that prevail in this country. A departure from standard design which I would like to see at the Show, or in the pages of *The Motor Cycle*, is the location of the driving system, whatever form it takes, on the right-hand side of the machine. Of course, there may be some deep mechanical reason which renders this impossible. It *might* also render tappet adjustment less easy. I was once a passenger on a well-known American machine when we broke both driving chains simultaneously five miles from home. It was pitch dark, and the roads were muddy. For two hours we toiled on our backs with the aid of a flash lamp. Then our patience became exhausted, as did the flash lamp.

I walked three miles to the telephone to summon assistance. The lady in charge shrieked when I entered. I was surprised at the time, but sympathised with her later. I do not think this incident would have occurred had it only been the tappets that required adjustment. SIMPLICITAS.

Cork.

THE UMBRELLA COAT.

Sir,—In "Occasional Comments" in a recent issue of *The Motor Cycle*, I notice mention of the "Umbrella Coat."

I would like to endorse "Ixion's" remarks *re* this type of coat, and, like him, would very much like to know if it is still obtainable, and if so, where? as it is, in my opinion, the only sensible type of waterproof for motor cycling all the year round.

The coat must, of course, be of the black rubber outside proofed variety, as I have no time for the double texture material sold to-day—just two layers of cloth with an interlining of some stuff about as waterproof as butter muslin.

The majority of waterproofers I have been to, trying to obtain the type of coat previously mentioned, have told me that outside proofing is wholly unsatisfactory for motor cycling. Yet I have had one so made for three years: and on Salisbury Plain one gets some weather to test a coat. I suppose there is more profit in the double texture variety, as the proofing is hidden, and in consequence manufacturers can, with their present-day traditions, put any sort of rubbish in. F. A. SUMMERS, Capt.

OUT-OF-DATE BRITISH RECORDS.

Sir,—During the past few months record-breaking has been a very active branch of the sport of motor cycling. Many attacks have been made on existing figures, yet it is apparent that almost all have been made on long distance records in one or two particular classes. Thus, certain records in Class B (up to 350 c.c. solo) have changed hands three and even four times during the last few months. Considerable activity has been displayed in Class C (up to 500 c.c. solo), the Harley-Davidson has captured all long-distance records in the 1,000 c.c. sidecar class, and Nortons, seemingly, are the only people who covet sidecar records in Classes G and H. Beyond this nothing startling has occurred. Classes A and A1 are unchanged since pre-war days, save for one or two odd records recently set up by Jacobs. Cannot the Levis or Diamond figure here?

The 1,000 c.c. solo class seems to be almost wholly neglected, and most of the records standing in this class date from 1913 or thereabouts. The flying kilo speed—93.48 m.p.h. —does not strike one as very up to date, considering that the corresponding American figure is 115 m.p.h., and the 350 c.c. class record, viz., 75 m.p.h., is only 18 m.p.h. slower.

Another noticeable fact is that only two kilo or mile records have been broken since 1915. Why is this? Surely modern machines are not getting slower? How about the little racing A.J.S., the twin Rudge, or the new 500 c.c. o.h.v. Douglas? LEWIS E. GREEN.

SANS MAGNETO.

Sir,—I have been much interested lately in the correspondence on running a motor cycle "*sans* magneto" which has appeared lately in *The Motor Cycle*.

I have experienced the same thing with both a Triumph and a Rudge, after riding the machines fast for a long time. In each case I have noticed it when a somewhat loose waterproof plug connection has become disconnected.

With the Rudge I have more than once kept the engine running like this, with the clutch "out," while I "dabbed" the connection on to the plug again. It was not easy to do this with the Triumph, owing to the nearness of the tank to the top of the plug.

As the somewhat intermittent explosions were accompanied by a sickening knock I only did it for the edification of a friend, to prove that it was possible. PERCY K. DAVIS.

A WARNING TO LADY PASSENGERS.

Sir,—Although a constant reader of your paper for a number of years this is the first time that I have ventured to address you, and I do so in the hope that my experience may prove a warning to some of your readers. A short time ago I was returning from the golf links with a lady passenger in the sidecar. She was wearing a long scarf wrapped once round her neck; and the end of it caught in the sidecar wheel. She not only received a severe wrench, but all the skin on the right side of her neck was taken off. Fortunately we were going slowly at the time, and, fortunately, it was a light summer scarf which broke under the strain. I shudder to think what would have happened if we had been going fast, and it had been a thick woollen muffler. In future my passengers will have their wraps well and carefully tucked away and (despite the traditional pictures) no loose ends floating in the breeze. FELLOW, SALOP.

A MODERN JUGGERNAUT.

Sir,—Whilst sympathising with the victim of the accident with the fire engine, I cannot agree with "Douglas" that it would be a good thing to impair, by imposing a speed limit, the efficiency of this splendid service, which "saves" many lives and much property, because of one unfortunate accident.

I think, and am sure many will agree with me, that this case emphasizes the fact of the prevailing carelessness of a very large number of road users. My reply to the question, "Who turns a corner expecting to meet a huge vehicle doing 30 m.p.h.?" is—Every good rider! The experienced rider knows that almost daily now one has to use one's commonsense rather than rely on L.G.B. regulations and rules of the road to avoid accidents.

This brings me to another point that is noticeable just now, viz., the dangerous practice of relying on the use of a horn to get a "clear passage." If everyone on the road realised that the use of a horn or other noise machine was for the purpose of "giving audible warning" of approach and *not* for "clearing the road," I am sure many accidents would be avoided. TWENTY YEARS ON THE ROAD.

Notting Hill, W.11.

ARROWING THE COURSE.

Sir,—I see some remarks in the issue for October 7th, on the trouble caused by small boys altering directional arrows, in recent trials.

The type of arrow suggested by our correspondent, Mr. F. A. Ellis.

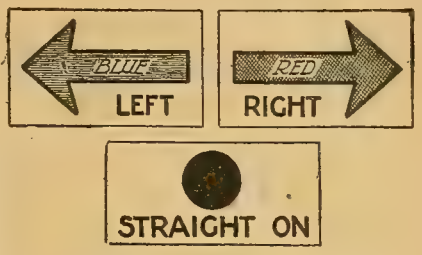
I thought that the enclosed diagram might prove itself somewhat of a solution, the usual arrow being used, but one corner of it slightly "blocked out." It could easily be made known to competitors that the arrow was pointing in the intended direction, when the "block" was on the upper edge of the arrow, or *vice versa*. F. A. ELLIS.

Sir,—I notice in your publication dated 7th October, page 421, reference to the difficulty of arrowing trials, owing to the interference of meddlesome youths and others who remove or turn round existing direction pointers.

Might I submit the following scheme for your approval?

I might say that this scheme worked satisfactorily in the recent Scott Trial, and as far as can be ascertained there were no complaints as to the direction of the arrows.

Briefly the plan is as follows: "Turn to the right" is a white card on which is printed a red arrow (pointing to the right) underneath which is the word "Right." This sign is placed before the turn on the right hand side of the road.



Types of cards suggested by Mr. N. O. Vinter in his accompanying letter.

Turn to the left is a white card, with a blue arrow, with the word "left" underneath. The arrow turns to the left, and the card is placed on the left side of the road.

"Straight on" is a white card "with a black circle in the centre, underneath which are printed the words "straight on." This also is placed on the left side of the road.

It will be quite obvious from the foregoing that not only is it impossible to mistake the turns owing to the two factors, colour and printing; but also should a competitor lose his way and regain the main road, it will be obvious from looking on which side of the main road the arrow is placed as to which way he must proceed. This will prevent the possibility of any competitor following the arrows in an adverse direction. N. O. VINTER.

Sir,—As one who has suffered, perhaps you will allow me to comment on your paragraph on the arrowing of trials. Your suggestion, of underlining, is excellent, but, in my opinion, the use of arrows at all is obsolete. It is frequently impossible to see which way the head points until arriving quite at the turn, particularly when the arrow is fixed to a telegraph or signpost. A far better system is to have coloured cards with the letters R. L. and S. (straight on) on them; but the best system of all is powdered yellow ochre, as used by the Edinburgh M.C. This is cheap, laughs at the efforts of the inevitable small boy," resisted the wettest Scottish Six Days Trial ever known, and yet does not make an unsightly mess of the roads. Confetti is expensive and very hard to see, and, in my opinion, a waste of money.

One word to those misguided clubs which still pin their faith to the mediæval arrow. Instruct your—may I say it?—"archers" to place their arrows where they can be seen by the approaching competitors. Often the arrow is conspicuous when standing close to it, but very hard to see when coming towards it. An eminent competition rider and myself were robbed of golds by inattention to this detail in a recent open trial. J. M. PHILPOTT.

Sir,—As the present prices of fuel make the question of fuel consumption of some pecuniary importance, perhaps my experience may be of interest to fellow readers.

My mount is a 1919 3½ h.p. Sunbeam, fitted with Amac two-lever carburetter; my fuel consumption in 4,000 miles has been:

	m.p.g.
First thousand miles (1,009 miles, 14½ gallons) =	70
Second thousand miles (1,046½ miles, 13 gallons) =	80
Third thousand miles (886½ miles, 9 gallons) =	98
Fourth thousand miles (1,001 miles, 8⅜ gallons) =	119

In the first thousand miles I used petrol for about half the distance, benzole for the rest; after that, save for a rare gallon of petrol, benzole was used entirely. A W.S.R. adjustable jet was fitted at the beginning of the second thousand miles, and mid-way through it "Spots" were used, and have been used ever since. Rather more than half-way through the third thousand miles the gauze at the air-intake of the carburetter was found to be much blocked with a greasy soot, due largely, I have no doubt, to running with too strong a mixture on first using Spots. I have noticed a blow-back only on operating the kick-starter. Before cleaning the gauze I had used the carburetter with the air-lever fully open except for starting; after cleaning I found I had to close the air-lever to (roughly) the same position

as the throttle-lever, and the consumption improved at once by twenty miles per gallon. Included in the fourth thousand miles are two trips each of about one hundred miles, on which the consumption was in the neighbourhood of 130 miles per gallon; otherwise my riding has been short, almost daily, runs, with a halt about every five miles, and mostly on by-roads with a full share of hills. Fuel-level was so set that on removing throttle and air slides the fuel can be seen standing in the holes of the multiple sprayer.

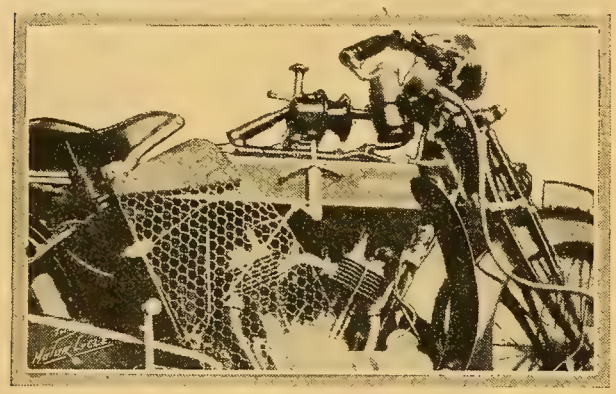
Like some other correspondents, I wish the W.S.R. jet people would make it with a more gradual bevel; even on changing from benzole plus "Spots" to Shell No. 1 the adjusting milled head requires moving only about one quarter turn. SUNBEAM.

Saltburn-by-the-Sea.

AN INEXPENSIVE DRESSGUARD.

Sir,—The photograph shows a simple device which I have made to keep my skirt and top coat from touching against the engine of my motor cycle.

It is a pea seed guard from the garden, straightened out, and bent over the petrol tank, where it is padded with material to prevent it from scratching the enamel, and it is



This dressguard, referred to in the letter of Mrs. Atherley-Jones, cost but 8½d. to make.

held in place by straps put through the wire at the corners and twisted round the supports of the footrests or anything handy that is not in the way of the engine.

The pea-guard cost 8½d., it can be detached in a minute, and does not at all interfere with the cooling of the rear cylinder. (Mrs.) H. ATHERLEY-JONES.

SPEED.

Sir,—I have read your splendid journal ever since I took up motor cycling, and have been particularly interested in your pages of correspondence. The wonderful achievements of some of your readers as regards speed and power of their machines have so stirred me that I have felt compelled to test my own little 'bus, to see what it really can do.

My machine is a 2¾ h.p. four-stroke. Heretofore, I had been content to plod along at a good average 20 m.p.h.—solo, of course. However, determined to try the little 'bus to its uttermost I fitted a coach built sidecar to it and wheeled the outfit out of the garage to start on my great adventure.

Living as I do in the West Riding of Yorkshire, I decided that a trip to Leeds, twelve miles distant, would be a very decent test, as this area has the finest collection of pot-holes, badly laid tram-lines, cobbles, narrow roads and stiff gradients that one could find in a twelve months' tour.

With a twelve stone passenger up I set off. The little engine pulled beautifully. Descending into a No. 1 pot-hole I rushed the opposite gradient of 1 in 4 on top. Elated with this success I faced a long climb of about two miles of 1 in 14 with equanimity. How the little engine purred as I rushed the gradient! Twenty, thirty, thirty-five, forty, the speedometer pursued its course. My passenger cowered in his funk hole. With hands hard gripping and a bubbling heart I watched the distant summit. Forty-five now; fifty, fifty-five—ah! . . . .

The grey, cold, clammy dawn was creeping through the window. Adjusting the sheets I turned over on my left side, happily conscious of three more hours in bed. L.S.

HINGED FOOTBOARDS.

Sir,—I recently had my foot badly crushed by being "jammed" between the footboard and brake pedal, due to a fall. *Verb. sap.* B.

Naas.

THAT ELUSIVE KNOCK.

Sir,—There has been some discussion, from time to time, in motor journals regarding the exact cause of "knocking" in single-cylinder engines.

A correspondent recently attributed it to "detonation," explaining that a "detonated" and an "exploded" charge were two different things altogether. He also explains that in the case of detonation, the chemical change takes place throughout the whole mass of gas under compression *simultneously, i.e.*, each molecule unites, or breaks away, as the case may be at one and the same time, causing a violent "hammering" effect on the piston and cylinder walls—whereas in the ordinary explosion set up by the spark at the plug, the rate of combustion is slower, and not so violent.

Assuming the above to be correct, it should be possible to get "knocking" even with the spark fully retarded. Personally, I have always regarded "knocking" to be caused by an ordinary explosion of the gases taking place when the piston is "dead top," or before top centre: particularly when there is violent resistance to its downward progress owing to a steep hill, or too high a gear. The subject is interesting, and I should like to hear other readers' views.

RONALD S. WHITING.

SUMMARY OF CORRESPONDENCE.

A useful tip for P. and M. owners has been discovered by "F.H.M.C.," who states that a Ford valve may be readily adapted to the 3½ P. and M. engine when a proper spare is not available. It has the additional advantage of costing only 4s.

Two products of the chemist receive their mead of praise from motor cycling correspondents this week. Miss Kathleen Turnbull, of Spennymoor, speaks of a greatly reduced petrol bill after using "Spots": while the claims of "Twinko" as a quick method of cleansing the hands after road or garage adjustments are voiced by the Rev. F. Lyle Uppleby.

Entire satisfaction in his 1919 4 h.p. Triumph is expressed by Mr. G. H. Rogers, who asserts he has now done 7,000 miles without any tinkering, breakdowns, or even a single misfire. Consequently the cost of repairs and upkeep in this period has been *nil*.

Equally enthusiastic is Mr. W. Hexter Drew with his 1920 4¼ h.p. B.S.A. sidecar outfit. The outfit weighs, with two passengers, 8 cwt.; and succeeded in climbing Porlock Hill at its worst after dropping but one passenger.

The following agents and garages have recently been mentioned by correspondents for prompt and fair treatment: Messrs. J. L. Love and Co., Bromley; County Cycle and Motor Co., Birmingham; Maudes Motor Mart, London; and Streets, Tetbury.

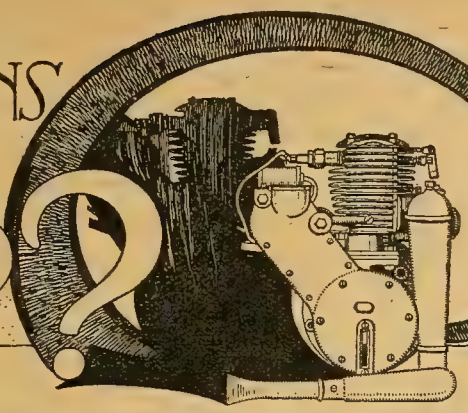
BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20 Tudor Street London, E.C.4, or of leading Booksellers and Railway Bookstalls

QUESTIONS AND REPLIES



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Tyre and Rim Sizes.

My machine is a 1914 4¼ h.p. single-cylinder model, and I am troubled with the rear tyre chafing at the beads. The rim is marked "Dunlop, 26 × 2¼," and I use tyres of the same size.—S.P.

The tyre trouble may be due partly to your methods of driving. If you allow the engine to labour on top gear, or if you use the clutch harshly, it is quite likely that the tyre will creep in the rim. You do not say whether security bolts are fitted, but if not, we should certainly advise you to use them. You might find also that oversize covers (26in. × 2⅜in.) would give you better results.

Gear Box Adjustment.

I have in my possession an N.U.T.-J.A.P. fitted with a Sturmey-Archer three-speed countershaft gear box. Recently, I had the misfortune to damage the constant mesh wheel on the layshaft. Having since fitted a new shaft together with a new ball race—on the kick-starter end—I have had trouble in getting the gears adjusted correctly, *i.e.*, when adjusted for neutral and engine is started, a clicking sound is clearly audible, and second speed engages suddenly without any movement of the speed lever. When adjusted nearer first speed it engages in the same manner. It appears to me that there is not sufficient space in the gear box for neutral. Therefore, can you please tell me, have I replaced the gears and race correctly? (In my opinion both are all right.) I might add that I have driven some 150 miles with it in its present condition, and all three speeds function correctly whilst engaged.—N.U.T.

Without inspecting the gear box we cannot tell you the cause of the trouble; it may be due to a slight variation in the layshaft dogs, or perhaps you have omitted to replace the layshaft spring washer when reassembling. Another possible cause of the trouble might be excessive wear of the small yoke-end pins on the operating mechanism; if play is allowed to develop at these points, the middle gear is quite likely to engage, even though the gear lever is placed in the neutral position.

Higher Gear Required.

(1.) How can I raise the gear on my 4 h.p. Triumph from 5 to 1 to 4 or 3½ to 1? (2.) What is the highest speed I should get with the present 5 to 1 gear? (3.) What difference in speed would a 3½ or 4 to 1 gear make? (4.) What is the best size jet to use on a Triumph carburetter for speed?—G.H.

(1.) You can raise the gear by fitting a larger sprocket on the engine shaft, but we strongly recommend you not to exceed a top gear of 4¾ to 1. 3½ or 4 to 1 are quite useless. (2.) About 50 m.p.h. (3.) The running would be exceedingly harsh on such a gear, and it is quite likely that the maximum speed would not even be so high. (4.) Size 30 or 32.

IMPORTANT DATES.

Nov. 4th-13th—
International Automobile Exhibition, Olympia and White City

Irregular Firing of V Twin.

Recently a valve rocker arm broke in my 5-6 h.p. twin, and consequently the engine had to be retimed. No. 1 cylinder now seems at fault, and although good compression is obtained there is very little power. With both cylinders firing, the running seems very irregular, and on testing each cylinder separately No. 1 cylinder is almost impossible to start (air leak tested). No. 2 cylinder starts immediately. Will you give me the correct valve timing for this?—M.G.S.

The exhaust valve should close when the piston reaches the top dead centre (or it may close slightly after the piston has passed this position); at the same point the inlet valve should be just commencing to open. If the compression in each cylinder is equally good, and if the valve timing is correct, the trouble is probably due to an ignition fault. Possibly the sparking plug is defective, or the high-tension cable may be damaged. Make sure also that the platinum points of the contact breaker separate equally for each cylinder. The ignition timing also should be verified; the spark should occur when the piston is on top dead centre of compression stroke with the ignition control two-thirds retarded.

An Incorrect Contact Breaker.

I have a pre-war 6 h.p. V twin. I have lately had the engine down for overhauling, and on reassembling, when I went to time the magneto, I found that I could not time both cylinders correctly. If I timed the back cylinder with the magneto two-thirds retarded, piston dead centre, and points just breaking, and then joined up, on turning over the engine till the front cylinder was dead centre, the points would not be breaking, and would not commence to break till the piston was about a quarter of an inch on the downward stroke; and, of course, if I timed the front cylinder correctly the points would be breaking too early on the back cylinder. I shall be much obliged if you can inform me: (1.) Is not this wrong? (2.) Could this be caused by any error in reassembling the engine, or would it most likely be a worn magneto cam? (3.) Can I have the magneto cam altered to make the break at the correct time, or, if not, what ought I to do?—H.A.B.

(1.) If the timing is as you describe, it is certainly incorrect. (2.) Possibly you are using the wrong cam in the contact breaker casing, and it would be well to verify this, and make sure that each cylinder is connected to the terminal from which the high-tension current is delivered when the contact breaker is being operated by the corresponding cam. (3.) Without actual inspection, we cannot tell you whether the magneto is suitable for the engine, but it is just possible that you have a magneto for an engine of a different angle. A slight alteration of the cams would probably put matters right. Both cylinders should be timed in exactly the same way, and there should be no variation in the ignition point.

Life of Plain Bearing Engine.

I have a two-stroke machine fitted with a well-known proprietary engine. Will you kindly give me your candid opinion as to the following points: (1.) I understand this engine has plain bearings throughout. Are these satisfactory? (2.) How do they compare with ball or roller bearings for wear? (3.) Should I be likely to get equal service from such an engine as I should from a machine made throughout in one factory?—H.K.S.

(1.) The engine in common with most small two-stroke power units has plain bearings. These are quite satisfactory, provided that proper lubrication is maintained. (2.) With an adequate lubrication system, the life of plain bearings is almost as long as that of ball or roller bearings. (3.) You should expect to get the same service from your machine as you would from any other machine of similar class or price.

READERS' REPLIES.

Has Benzole a Deleterious Effect?

Referring to "G.A.C.'s" letter in *The Motor Cycle* dated September 23rd, I think I can help him in his trouble. I am works chemist connected with the manufacture of benzole, and have found by test that a good quality benzole (*i.e.*, well washed) has absolutely no ill effects. As every manufacturer knows, however, it is very difficult to obtain benzole in quantity perfectly free from water. This water probably will not show at first, but after standing for a considerable time, as in the tank of a machine, settles down to the bottom. In time, after using a fair quantity of benzole, you get fairly large size globules of water. This, of course, will soon rust a poorly lined tank, and you get what "G.A.C." found. With a slight increase in production cost, this water could be eliminated.—L.D.

Chain Stretch.

With reference to "H.A.H.'s" query and your reply in the issue of October 7th regarding chain stretch, I recently wrote to Messrs. Hans Renold, Ltd., on this point, and their reply would probably be of interest. They wrote me as follows: "The test as to when a new chain should be put on a machine is when the old one ceases to gear well with the large sprocket wheel owing to extension of pitch due to wear. In general it is practical to use chains up to about 3% extension when pulled taut." I may add that my chains, running in oil-bath gear cases, have done over 11,000 miles, and do not yet show any considerable signs of wear; the extension is only about 1% on the rear chain, and a little more on the front.—W.D.M.

ALFRETON TO TRING.—F.C.T.

Ripley, Nottingham, Melton Mowbray, Oakham, Uppingham, Kettering, Finedon, Wellingborough, Newport Pagnell, Hochliffe, Dunstable, Tring.

SPALDING TO ASHFORD (AVOIDING LONDON).—T.J.

Peterborough, Norman Cross, Alconbury Hill, Biggleswade, Hitchin, Hatfield, Barnet, Eltham, Wrotham Heath, Maidstone, Charing, Ashford.

LEICESTER TO MARGATE.—F.H.

Leicester, Market Harborough, Kettering, Higham Ferrers, Bedford, Shefford, Hitchin, Stevenage, Hertford, Ware, Harlow, Chipping Ongar, Brentwood, East Horndon, Tilbury, by ferry to Gravesend, Rochester, Chatham, Sittingbourne, Canterbury, Sarre, Margate.

The first sidecar taxi to be licensed in Surrey. Alex. Willis, the owner, has fixed his charge at threepence per mile for one passenger and sixpence if the extra seat is also occupied. Threepence per mile, as a commercial proposition, would appear to be cheap when all expenses are considered.

South African T.T.

In August the first South African T.T. race was held over a 142½ miles course. An Indian won the junior event (500 c.c.), with a Douglas second, while in the intermediate class a Triumph was first, and a Douglas again took second place.

S.A.T.T.

"The Birmingham House for Motorists," as Mr. P. J. Evans's premises at 83-91, John Bright Street, are termed, is shortly to be considerably extended. When the improvements are completed the motor cycle and car sections will be departmentalised.

A New Accessory Firm.

A preliminary folder, with the title "Dekla Details," has just been compiled by Messrs. Clayton-Wright Bros., of 168-169, Hampton Street, Birmingham. In it are described the firm's various accessories, such as cycle lamps, motor horns, and observation mirrors.

Cowey Speedometers.

On page 413 of our issue of October 7th, a paragraph embodied in an article on "Testing a Speedometer," gives an impression that the sales of the popular Cowey instruments in London are controlled by one firm. This, of course, is not so, as the products of the Cowey Engineering Co., Ltd., are obtainable through all agents of standing.

Taxi-sidecars in Devon.

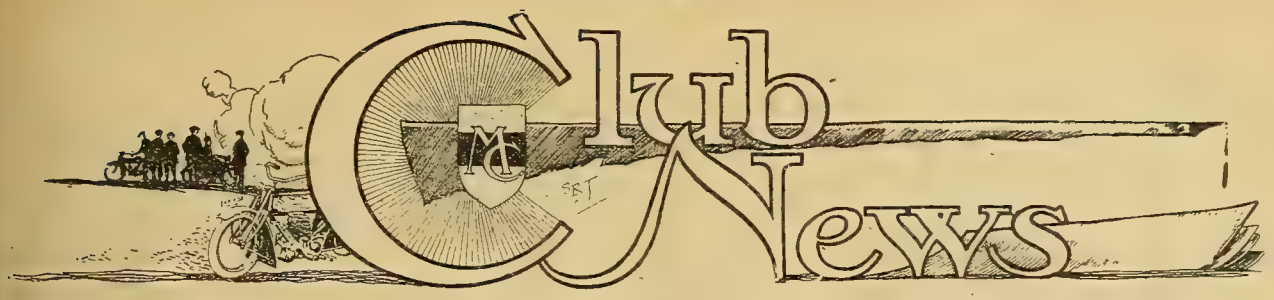
In our issue of July 15th we referred to a service of luxuriously fitted taxi-sidecars installed by the "X" Motor Cycle Co., of 55, Parkfield Road, Torquay. We understand that these sidecars are doing extremely well, and cover about sixty miles a day. One of the machines is always available for hire on the rank up to midnight.

Bull Dog Motor Cycles.

The maker of the Bull Dog motor cycles, which are fitted with Coventry Victor flat twin engines (Mr. H. H. Timbrell, 59, Slaney Street, Birmingham), has been compelled to relinquish his business, and the premises and stock have been taken over by Messrs. The Slaney Engineering Co., from whom spare parts may be obtained.

Bowden Brake Co., Ltd.

The directors' report of the well known Tyseley (Birmingham) firm, which specialises on the manufacture of Bowden fittings, shows a very satisfactory state of affairs for the year ending August 31st, 1920, there being a net balance of £45,033 11s. 2d. available for distribution, as against £26,737 11s. 5d. of the previous year. An interim dividend of 10% free of tax has already been paid. A final dividend, making a total of 15% for the year, is recommended. After allotting large sums to various funds and reserves, £15,033 11s. 2d. remains to be carried forward.



N.M.C.F.U. (Portsmouth).

The N.M.C.F.U., Portsmouth, are holding their first petrol consumption trial, open to all club members, on Saturday next, over a ten mile triangular course, starting from the George Hotel, Portsdown Hill. It will be run on A.C.U. formulæ, and the course will be observed.

Romford and District M.C.C.

A reliability trial to Cambridge and back, a distance of 105 miles, was held on the 3rd inst. Competitors were each allotted one hundred marks at the start, and one mark was deducted for every minute early or late at a named or secret check. There were six named and four secret checks. The results are as follows: 1, D. Maitland (2¾ Douglas), 94½ marks; 2, W. S. Welsford (4 Triumph sc.), 93½ marks; 3, R. C. Fox, jun. (2¼ Triumph), 92½ marks. In addition, seven first, seven second, and four third-class certificates were awarded.

Stourbridge M.C.C.

As reported in our last week's issue only twenty-nine finished out of forty-eight starters in this club's half-day trial; and as the course was under fifty miles in all, this gives some indication of the severity of the event. The following results are now to hand:

CLASS A (350 c.c.).—1, B. Kershaw (2¼ Verus); 2, F. J. Price (2½ Diamond-Jap).

CLASS B (500 c.c.).—1, F. Drew (3½ N.U.T.); 2, F. J. Wilkes (3½ Rover).

CLASS C (over 500 c.c.).—1, J. Dosher (8 Enfield); 2, F. Jew (3½ Norton).

CLASS D (Sidecars).—1, E. Williams (5-6 A.J.S. sc.); 2, B. Bladder (8 New Imperial-Jap).

SINGLE-GEAR PRIZE.—C. Higgs (4 Triumph).

TEAM PRIZE.—Worcester and District M.C.C. "C" Team (B. Kershaw, J. Dosher, and B. Bladder).

Southend and District A.C.

Some excellent speeds for a closed club event and ideal weather conditions favoured the Kilometre Speed Trials on October 9th. In the solo classes H. G. R. Stewart (3 A.B.C.) and N. A. Lowe (2½ Diamond-Jap) made the "star performances," as the results, on time, show:

CLASS I. (350 c.c.).—1, N. A. Lowe (2½ Diamond-Jap), silver medal (speed 45 m.p.h.).

CLASS II. (500 c.c.).—1, H. G. R. Stewart (3 A.B.C.), silver medal (speed 53.4 m.p.h.); 2, D. A. Bennet (3½ P. and M.), bronze medal.

CLASS III. (Unlimited).—1, H. G. R. Stewart (3 A.B.C.), silver medal (speed 51.4 m.p.h.); 2, Lt. Kenny (4 Triumph), bronze medal.

CLASS IV. (350 c.c., Sidecar).—1, N. A. Lowe (2½ Diamond-Jap sc.), silver medal (speed 36.15 m.p.h.).

CLASS V. (500 c.c., Sidecar).—1, N. A. Lowe (2¾ Diamond-Jap sc.), silver medal (speed 36.15 m.p.h.).

CLASS VII. (Unlimited).—1, Lt. Kenny (4 Triumph) (speed 51.2 m.p.h.); 2, H. G. R. Stewart (3 A.B.C.).

CLASS VIII. (1,100 c.c., Cycle Cars).—1, Austin Webb (4 A.S.C.) (speed 37.38 m.p.h.); 2, L. Taylor Morgan).

Special Prize of 6-gn. SILVER CUP for fastest time of day.—H. G. R. Stewart (3 A.B.C.).

2-gn. FLOWER VASE for fastest time of any three-wheeled cycle car.—A. W. Webb (4 A.S.C.).

SILVER MEDAL for best performance by a scooter.—E. Temple (A.B.C. Skootamota).

Week-end Club Events.

Oct. 23.—Sheffield and Hallamshire M.C.C. Bisby Trophy Trial.
Oct. 23.—Coventry and Warwickshire M.C. Speed Judging and Reliability Trial.
Oct. 23.—Dewsbury and District M.C.C. Reliability Trial.
Oct. 23.—North London M.C.C. Annual Dinner.
Oct. 23-24.—Public Schools M.C.C. 300 Miles Trial.
Oct. 24.—Lancaster, Morecambe, and District M.C.C. Reliability Trial.
Oct. 24.—Brighton and Hove M.C.C. Gymkhana.
Oct. 24.—Birmingham M.C.C. Captain's Day.
Oct. 24.—Reading and District M.C. and L.C.C. Club Run.
Oct. 24.—Stalybridge and District M.C. Social.
Oct. 24.—Eastbourne and District M.C.C. Consolation Event.
Oct. 24.—Manchester M.C. Closing Run.
Oct. 24.—Bedford and District M.C. and L.C.C. Closing Run.

Lancaster, Morecambe, and District M.C.C.

The Lancaster, Morecambe and District Club recently held a run to the notorious Park Rash (Kettlewell), and experienced a most enjoyable day. The weather was perfect, and although not as many members turned out as was expected, a fair amount of sport was witnessed on the hill. The surface was dry, and in better condition than it is wont to be. Good climbs were made by most of the competitors after their second or third attempts. R. F. Mansergh (3½ N.U.T.) succeeded in getting within inches of the top at his first attempt at the hill, and J. Whalley (3 A.B.C.) (solo machine) was successful in climbing the hill with a lady sitting on the carrier, after previously "conking out" at the first bend. Other good climbs were made by C. R. Wolfendale (6 Zenith) and G. H. Ducksbury (3½ Norton). Only one sidecar machine, an 8 h.p. Clyno, driven by R. C. Ducksbury, tackled the hill and eventually got up comfortably with the passenger on the carrier.

Coventry and Warwickshire M.C.

Three valuable trophies, which will be allocated on the basis that the highest value goes to the class receiving the largest entry, are offered in the closing run of this club. The event, taking place on October 23rd, and not October 16th, as previously arranged, will take the form of a speed-judging and reliability competition.

Luton and South Beds A.C.

Successful speed trials were held by the above club on October 9th at Putteridge Park, near Luton. The course was 350 yards in length with approximately fifty yards start and 300 yards finish. Over 100 entries were received, and the results with the respective figures of merit, which were worked out on the formula $\frac{C \times T^2}{W}$ are as follow:

CLASS 1 (275 c.c., Solo).—1, F. F. Biggs (2¼ New Hudson), 341; 2, L. Kell (2¼ New Hudson), 441; 3, S. Risden (2¼ Kingsbury), 486.

CLASS 2 (350 c.c., Solo).—1, F. F. Biggs (2¼ New Hudson), 334; 2, S. Risden (2½ Kingsbury), 350; 3, P. Child (2¾ Douglas), 374.

CLASS 3 (500 c.c., Solo).—1, T. Bourlet (3 A.B.C.), 306; 2, J. Hill (3½ Rudge-Multi), 320; 3, F. F. Biggs (2¼ New Hudson), 322.

CLASS 4 (750 c.c., Solo).—1, J. Saddington (5-6 James), 296; 2, G. Davison (2¼ Levis), 314; 3, J. Hill (3½ Rudge-Multi), 320.

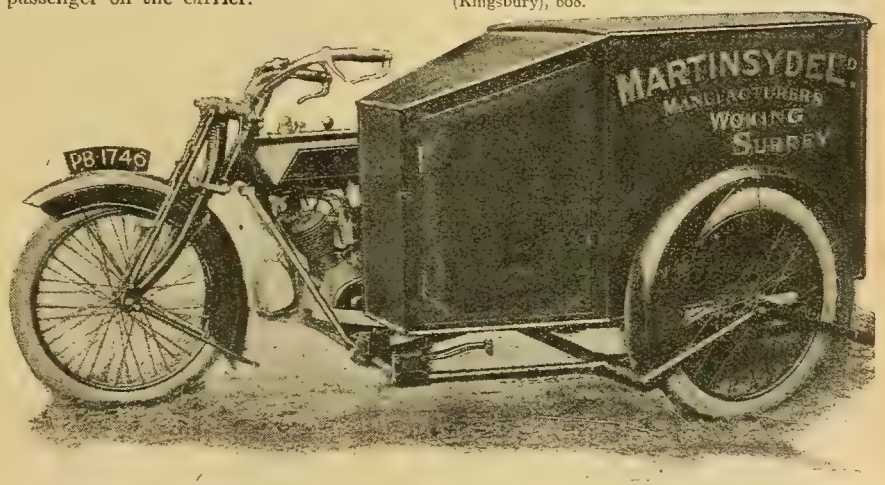
CLASS 5 (1,000 c.c., Solo).—1, J. Saddington (5-6 James), 260; 2, T. Bourlet (3 A.B.C.), 306; 3, G. Davison (2¼ Levis), 314.

CLASS 6 (500 c.c., Sidecar).—1, G. Davison (2¼ Levis sc.), 301; 2, J. Hill (3½ Rudge-Multi sc.), 340; 3, J. Simpson (3½ Ariel sc.), 342.

CLASS 7 (750 c.c., Sidecar).—1, G. Davison (2¼ Levis sc.), 286; 2, J. Simpson (3½ Ariel sc.), 292; 3, J. Hill (3½ Rudge-Multi sc.), 294.

CLASS 8 (1,000 c.c., Sidecar).—1, J. Simpson (3½ Ariel sc.), 282; 2, G. Davison (2¼ Levis sc.), 307; 3, H. Reyre (5-6 James sc.), 310.

CLASS 9 (Cycle Cars, 1,000 c.c.).—1, A. F. Nash (G.N.), 182; 2, P. Child (Morgan), 483; 3, S. Grigg (Kingsbury), 608.



The great potentialities in the sidecarrier field of business have been foreseen by Messrs. Martinsyde, Ltd., who have produced this soundly-constructed carrier. It is of ample dimensions, having a capacity of eighteen cubic feet.

French Morgans.

The Morgan Runabout is now being made in France under licence.

A World's Tour by Petrol.

An American yachtsman is about to start on a cruise round the world in a 120ft. motor boat. His party includes a number of students who will study fish and animal life, and for whom several motor cycles will be carried in order to explore the interiors of the various countries visited.

The Use of a Formula.

With many varying machines and a limited entry, the average club hill-climb or speed event undoubtedly calls for the use of a formula in allocating a certain proportion of the premier awards. But when the entry permits a complete range of capacity classes, the larger and heavier machines do not get justice if lightweights are allowed to run against them solely on formula. Instead of, say, the classification "under 750 c.c." or "under 1,000 c.c.," the fairer limitations are "500 c.c. to 750 c.c." and "750 c.c. to 1,000 c.c." It is ancient knowledge that to equal the figure of merit of a 2½ h.p. machine which does 30 m.p.h. a big twin must often do nearly 80 m.p.h.!

Second-hand Prices.

The fact that any particular machine or model is omitted from this list must not be regarded as a reflection on the importance of that make: it is solely that a lack of sufficient machines on offer make it impossible to base useful figures. The prices below are the highest and most figures quoted last week in our [illegible] advertisement columns.

[illegible]

Petrol Prices.

The deputation to the Mayor of Coventry concerning petrol prices, organised by the local branch of the A.A., appears likely to bear fruit. The Mayor brought the matter before the council, who decided that copies of the resolution be sent to all other councils requesting their support. Last week the Coventry Chamber of Commerce adopted a resolution couched in similar terms, which is being sent to all chambers of commerce throughout the country for endorsement.

It is only by energetic and persevering effort on the part of everyone affected that the Government will be brought to realise the vital importance of the necessity for a fuel produced within the Empire.

IN PICTURESQUE ROTTSENTHURM.

The owner of this Junior Triumph is a Swiss motor cycle enthusiast, who has covered 20,000 miles on his mount over all kinds of roads, and there are many varieties in Switzerland, as may well be imagined. His enthusiasm is a tribute to the makers of his machine.

Special Features.

A SPORTING TRIAL.

TRIALS FOR MAN OR MACHINE—WHICH STAMPED STEEL FRAMES.

Putting the Clocks Back.

Unless extended by a further Order in Council "summer time" reverts to normal after midnight, October 24th.

Racing in Holland.

A Royal Ruby, an A.B.C., a Harley-Davidson Sports, and a 7-9 h.p. Harley respectively, gained first places in the 350 c.c., 500 c.c., 750 c.c., and 1,000 c.c. amateur classes in recent sprint races at The Hague. At the same meeting Flinterman, on an Indian, won the 5,000 metre handicap for trade riders; while Brinkof (7-9 h.p. Excelsior) won the scratch race.

An Open Trial in Kent.

The last open event of the year will take place on November 6th, when the Woolwich, Plumstead, and District M.C. will hold its one day trial for the Matchless Cup. The course, which starts at Orpington, Kent, will be a secret one of about 100 miles, to be covered non-stop; and although the precipitous mountain tracks of some recent Midland trials may not be available, a strict marking system and late autumn weather conditions alone should make things sufficiently strenuous for most. Entries close on October 30th.

How . . . ?

"The running time for the journey will be *at the rate of twenty miles per hour*. A competitor *exceeding the speed allowed by law*, whether in villages or in open country, will render himself liable to disqualification. Drivers must *proceed cautiously through towns and villages*, and show consideration to other users of the road. . .". That is Rule 7 of a forthcoming trial. The italics are ours. We repeat—How . . . ?

Worse.

Apropos the above, which is, after all, but a detail error in drafting the rules, and is not very wrong in principle, a trial, which shall be nameless, takes place this week-end, in which the average speed for one section of approximately eighty miles is 24½ m.p.h. Add to this the fact that the event is on a Sunday, and we get a fair reason why competitions tend to become unpopular alike with the police and the public.

A Matchless Cycle Car.

It is not impossible that one of the 1921 Matchless models will be a cycle car.

A Retirement.

Mr. C. A. Hyde, managing director of B.S.A. Cycles, Limited, having decided to retire from the services of the Birmingham Small Arms Co., Ltd., has tendered his resignation to the Board, by whom it has been regretfully accepted.

The Coal Strike.

The coal strike and threatened curtailment of railway service caused an increase in the demand for petrol last week. Later on restrictions may be placed on petrol for private use, but probably everyone who has need of his machine will be able to obtain supplies. During a crisis of this character very few motor cyclists will want to use their machines needlessly.

Harley-Davidsons at Brooklands.

No doubt owing to the fact that in America, big twin racing engines of over 1,000 c.c. are fairly common, a rumour gained birth that the 7-9 Harley-Davidson that has recently been so successful in sidecar events at Brooklands was also oversize. The identical machine, however, went for the five and ten miles records in the later 1,000 c.c. sidecar championship, incidentally smashing both, and as is usual in such cases the engine was officially measured. This examination disclosed the fact that the engine was slightly undersize—and this after 9,000 miles on the road.

Clovelly High Street Climbed.

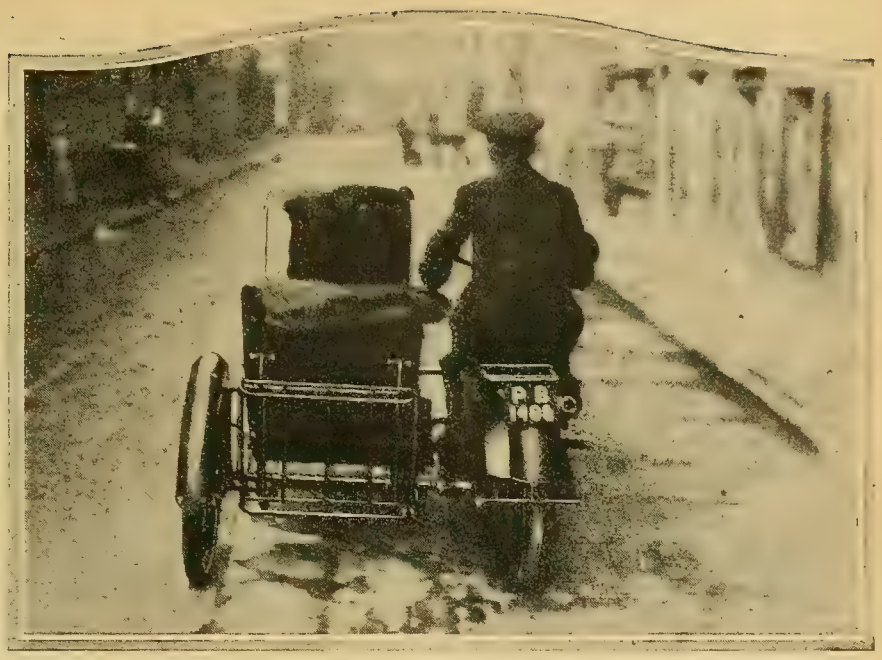
In pre-war days W. H. Carson was well-known on account of his successful attacks on freak hills. He has now recommenced his hobby by climbing Clovelly High Street on an Excelsior sidecar, on Friday of last week. This street, as most readers are aware, is practically a series of terraces or steps, which are paved with kidney stones. The steps number forty-six, and vary in height from 3in. to 7in. Both the approach and the end portion of the "street" are steep in gradient and difficult to negotiate. R. E. Walker also climbed the street non-stop on a 2½ h.p. two-stroke model of the same make.

A Number Plate Suggestion.

When taxes are increased next year, there will naturally be greater reluctance on the part of motorists to pay the annual tax promptly. If such is the case, we may witness and be inconvenienced as during the present year by hold-ups by the police. Mr. W. H. Wells, of

A number plate suggested by Mr. W. H. Wells

Indian motor cycle fame, suggests that the authorities adopt the principle in vogue in America by issuing number plates themselves which would bear the name of the county instead of index letters, and the year of currency. The illustration on this page shows the form these number plates would take.



THE COAL STRIKE.

A careful householder making sure of the household supply of coal with the aid of his sidecar.

An Echo of the West Midland Trial.

It will be recalled that several competitors in the recent West Midland trial missed one of the special tests through the removal of arrows by mischievous boys. We have before us correspondence relating to this matter from Mr. J. A. Newman and the organising secretary, but the matter is not of general interest. It was, of course, distinctly unfortunate for competitors to lose marks on this account, but as the organising committee has made its decision, no good purpose can be served by ventilating the discussion in our columns.

The Wiles of the Motor Cycle Thief.

A prospective buyer of a 4 h.p. Douglas after a trial run on the carrier expressed a desire to try the clutch, and, in the words of our correspondent (Mr. A. E. Barrett, 205, Elmhurst Mansions, Edgebury Road, Clapham), "he did try the clutch, and that was the last I ever saw of my machine." This ingenious gentleman is described as between thirty and thirty-four years, fair-haired, and possessing a round, puffy, clean-shaven face. Sellers beware!

B.M.C.R.C. Annual Dinner.

The club banqueting season once more draws near, and the British Motor Cycle Racing Club, to the fore as usual, is among the earliest to announce its annual dinner. This will be held at the Holborn Restaurant on Wednesday, December 1st, during the Motor Cycle Show week. The dinner will be confined to male members of the club, and after the repast the prizes won at Brooklands during the 1920 season will be presented. An excellent musical programme has been arranged. Early application for tickets is requested, the arrangements being in the care of Mr. F. W. Barnes, Zenith Motor, Ltd., Hampton Court, and Mr. W. Pratt, the Nook, 113, Rectory Lane, Tooting, S.W.

The New Taxation.

Even some people who should be better informed appear to labour under false impressions regarding the taxes for 1921. Weight, *not* h.p., is the basis; machines up to 200 lb. are to be taxed 30s., over 200 lb. 60s.; sidecar attachments, 20s. The idea that the owner of a 7-9 h.p. outfit will pay £7 or £8 is quite erroneous; £4 is the maximum.

Satisfactory Trading.

The balance sheet of the Enfield Cycle Co., Ltd., shows a total credit balance of £81,677 14s. 11d., of which sum a dividend of 7% has been paid on A preference shares for the half-year ended 28th February, 1920. The directors now recommend a further dividend of 7% on these shares for the half-year ended 31st August, 1920, and a dividend of 15% (free of income tax) on both B preference and ordinary shares for the period ended 31st August, 1920. £45,604 1s. 8d. is carried forward.

Numbered Roads.

The Ministry of Transport scheme for numbering and classifying roads throughout Great Britain is nearly completed, and will be put into operation early next year. It is estimated that there are, roughly, 1,000 first-class or main roads and 1,000 second-class roads, and each will bear a distinctive number on signposts throughout its length. The London-Edinburgh road will be No. 1.

The scheme is quite an extensive one. All the old signposts now on the roads will become obsolete and be taken down and replaced by the new numbered posts, which will also show the district in which they are situated and the distance to the nearest town.

Second-class roads will bear signs of different colour from first-class.

At the entrance to every village, on all main roads, a large sign will be erected giving the name of the village.

C7

Detail Improvements in the 1921 Matchless.

Larger Hubs and Smoother-running Engine.

NO startling improvements will be found in the popular Matchless sidecar outfit for 1921, but several small details have undergone alteration and improvement, and the largely extended Matchless works are now in a position to turn out quite a good number of machines per week. Not only have Messrs. H. Collier and Sons, Ltd., 44, Plumstead Road, London, S.E.18, produced their new model, but they are in the position to supply it immediately.

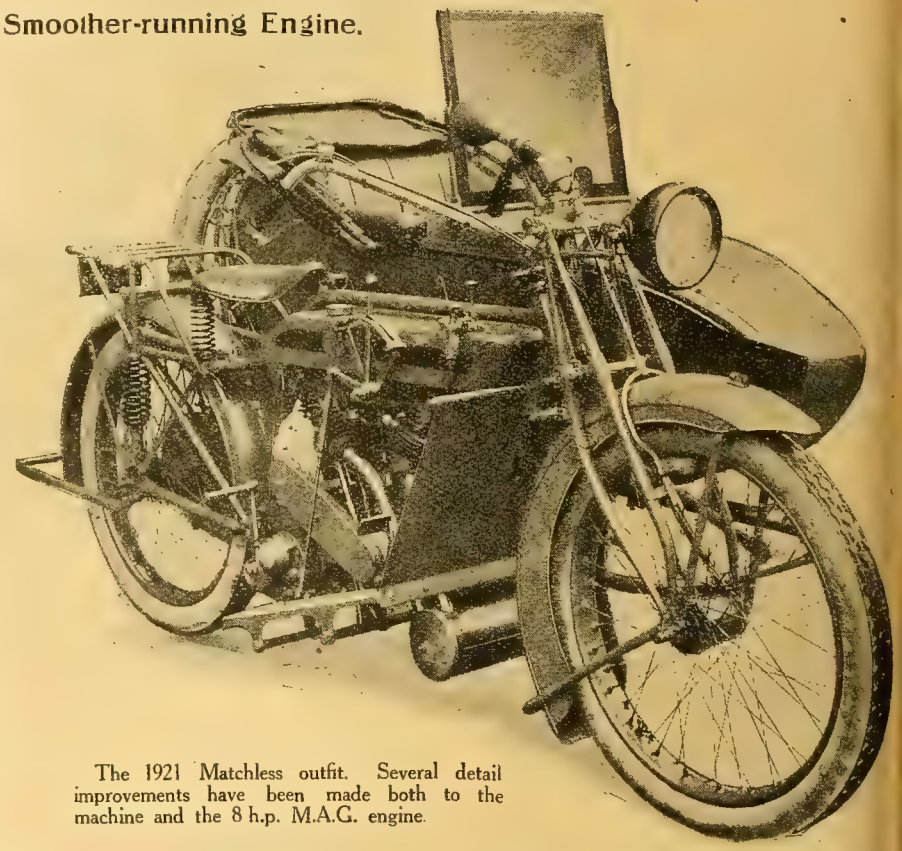
The chief 1921 innovations consist of larger hubs and wheel bearings allowing ⅜in. balls to be used. The lower front fork links have now been lengthened, and this increases the rake, improves the steering, and also enhances the efficiency of the fork. The sidecar is now fitted with a wider glass screen, affording better protection for the passenger, while the shape of the body has been slightly altered, so as to allow more clearance for the sidecar axle. As an extra, a band brake will be fitted to the front wheel if desired.

M.A.G. Engines now Standard.

All Matchless sidecar outfits are fitted with the latest model M.A.G. engine, which has undergone some improvement since the last Show. The three cams actuating the valves have been altered so as to give an increased lift to the valves, thereby improving the power of the engine. Yet another important improvement is the fact that the balance of the engine has been very much altered for the better, and the slight "period" has been removed from the neighbourhood of thirty miles an hour to a much higher speed.

Throughout the machine steel stampings are being used for the lugs in lieu of malleable castings, and everything which is humanly possible has been done to obtain highest possible efficiency in manufacture.

Bearing in mind the high quality of the Matchless, no change of price may be anticipated in the near future.



The 1921 Matchless outfit. Several detail improvements have been made both to the machine and the 8 h.p. M.A.G. engine.

While going round the excellently equipped and beautifully organised erecting shop, we saw a Matchless sidecar outfit fitted with box body, which is being supplied to Messrs. D. Napier and Sons, Ltd., for their road service.

The M.C. and A.C. Welsh Trial.

THE sporting open trial organised jointly by the Midland Cycle and Athletic Club and the South Birmingham M.C.C., which was dealt with fully in last week's issue, brought forth a great deal of comment in the Midlands owing to its severity. We refer to it, as an example of the present-day reliability trial, in the article "Trials for Man or Machine" on pages 460-462 of this issue, and give some of the rules and regulations as regards penalties.

We have now received the official results, together with a statement from the Committee to the effect that, owing to the weather conditions, it was decided to make a concession so that no competitor has been penalised for "touching" or "just hanging," only palpable failures counting against them.

Despite the fact that one rider—C. P. Wood (3½ Scott), did actually complete the course without loss of marks on the original rules, this is quite a fair way to deal with the matter, as the course was planned for a June trial when it might confidently be expected that conditions would be different from those prevailing in October. It may be recalled that the trial was postponed owing to a clashing of dates. By this "washing out" of the penalties for "touching" on hills, the very sporting event has been brought into the category of the true Reliability Trial.

Only those who traversed the course can fully appreciate the very fine performances put up by competitors who secured awards, and, knowing the conditions, we heartily congratulate all riders and the makers of their machines.

The Trophy Winners.

M.C. AND A.C. TROPHY (presented by Mr. C. F. Dawes) for best performance of the day, irrespective of class.—C. P. Wood (3½ Scott), lost no marks.

TRADER TROPHY (presented by the proprietors of the "Motor Cycle and Cycle Trader") for the best performance by any solo machine over 350 c.c.—C. P. Wood (3½ Scott), lost no marks.

B.N. BOWL (presented by the proprietors of "Bicycling News") for the best performance by any lightweight machine of 350 c.c. or under.—Neville Hall (2¾ O.K.-Junior), lost 10 marks.

GOUGH TROPHY (presented by Gough and Co.) for the best performance by any machine of 275 c.c. or under.—E. F. Goodman (2¼ Velocette), lost 10 marks.

PALMER TROPHY (presented by Palmer Tyres, Ltd.) for the best performance by any single-cylinder sidecar.—W. T. Woodcock (3¼ Ariel), lost 21 marks.

JORDISON TROPHY (presented by Mr. A. A. Jordison) for the best performance by any twin-cylinder passenger machine.—B. Bladder (8 New Imperial), lost 26 marks.

CLUB PRIZE, for best performance by a member of the M.C. and A.C.—A. E. Rollason (3¼ Ariel).

CLUB PRIZE, for best performance by a member of the South Birmingham M.C. Club.—J. F. Blumfield (6 Ariel).

CLUB PRIZE, for best performance by private owner.—H. J. Willis (3½ Ariel).

Medals.

LIGHTWEIGHT CLASS (275 c.c. or under).—Gold medal: E. F. Goodman (2¼ Velocette), lost 10 marks; silver medal, J. F. Lidstone (2¼ James), lost 20 marks.

SOLO MACHINES (350 c.c. or under).—Gold medal: Neville Hall (2¾ O.K.-Junior), lost 10 marks; silver medals: P. Pike (2¾ O.K.-Junior), lost 15 marks; J. W. Wills (2¾ Verus), lost 15 marks; B. Kershaw (2¾ Verus), lost 20 marks; L. A. Bees (2¾ Armis), lost 20 marks.

SOLO MACHINES (over 350 c.c.).—Gold medal: C. P. Wood (3½ Scott), no losses; silver medals: H. Langman (3½ Scott), lost 5 marks; A. E. Rollason (3¼ Ariel), lost 5 marks; W. Brandish, Junr. (4¼ Humber), lost 5 marks; L. L. Sealey (4½ B.S.A.), lost 7 marks; F. A. Longman (3¼ Ariel), lost 8 marks; T. W. Blumfield (6 Ariel), lost 10 marks; H. J. Willis (3¼ Norton), lost 10 marks; H. Hassall (3¼ Norton), lost 10 marks; L. Crisp (4½ Humber), lost 10 marks.

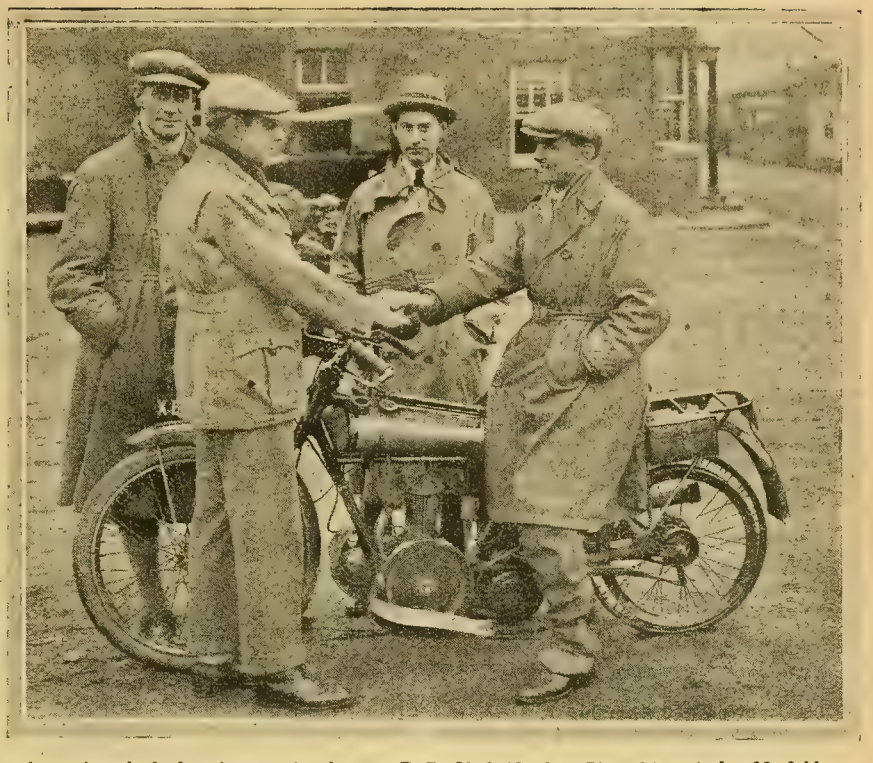
PASSENGER MACHINES.—Gold medal: W. T. Woodcock (3¼ Ariel), lost 21 marks; silver medal: B. Bladder (8 New Imperial), lost 26 marks.

Testing a Spring Frame.

Twenty-five Miles without a Tyre on the Rear Wheel.

IN order to test the Coulson spring frame, the makers of the 2¾ h.p. Coulson B motor cycle produced two of their machines at Golders Green during the week-end, one of which had no tyre on the rear rim, while the other had its tyres filled with Rubberine tyre filling. Before starting Dr. Low tested the spring frame with his bouncemeter, and proclaimed the results to be good. Both machines then proceeded to Hatfield, Rex Mundy riding the Coulson with Rubberine filling in the tyres, and R. B. Clark riding the other mount on the bare rim. The latter arrived at its destination in fine condition, without a spoke loose or a dent visible anywhere.

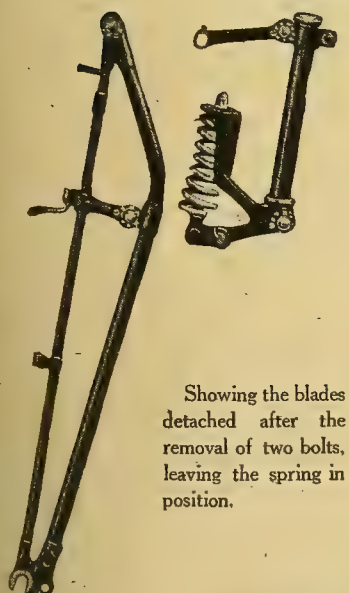
We tried a short run on Mundy's machine, and certainly with the spring frame it was difficult to notice any appreciable difference from riding upon air-filled tyres. Such tests, however, are not of much value unless of a prolonged nature under official observation, so we were not surprised to learn that Rex Mundy is shortly to take a 2¾ h.p. Coulson B with sidecar from London to Edinburgh without stopping the engine, and at the same time testing Rubberine in the tyres, under the official observation of the Auto Cycle Union.



A novel method of testing a spring frame. R. B. Clark (Coulson B) on his arrival at Hatfield, having ridden from Golders Green minus the back tyre.

A Simple Spring Fork.

Detachable Blades and no External Side Plates.

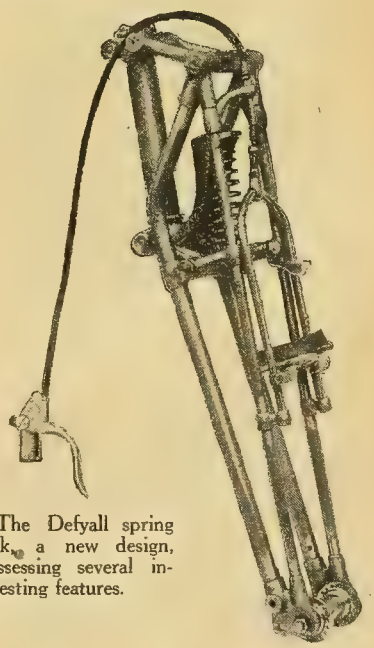


Showing the blades detached after the removal of two bolts, leaving the spring in position.

DURING the past few months a great deal of attention has been paid to the subject of front springing, as is instanced by the number of new spring forks which have appeared. The latest example which we have had the opportunity of examining is known as the "Defyall." This fork is manufactured in three sizes, for heavyweights, middleweights, and lightweights. It is neatly constructed, and has several rather unusual features. To begin with, the single centrally mounted spring is compressed between two links which move in opposite directions. The spring ends are fixed by studs attached to the ends of the coil with the nuts carried externally. Thus the nuts are easy of access, and can be examined at any time for looseness. In the unlikely event of a spring breakage there is but little danger of an accident, since the broken coil will simply close up, and finally the brackets will meet. A simple adjustment is provided to take up side play, and the bolts which are fixed in the blades work in very long bearings duly provided with oil grooves.

Easily Dismantled.

In addition to these advantages the blades can be entirely removed without disturbing the spring by merely detaching two bolts. Brake lugs are formed integral with the forks and stand, and mudguard fittings are also supplied. The fork is stoutly constructed and has a pleasing appearance, the detail work being well carried out. An unusual refinement is incorporated in the bearing bolts, as a special method for locking the nuts is provided, by means of which an adjustment of 1-300th of an inch can be made in order to take up any lateral play. Communications should be addressed to 14, New Street Birmingham.



The Defyall spring fork, a new design, possessing several interesting features.

C9

A Two-speed Gear for Lightweights.

Well-known Firm of Motor Car Gear Specialists producing for the Motor Cycle Market.

IT is with special interest that we are able to announce the entry of the Moss Gear Co., Ltd., the well-known gear specialists of Thomas St., Aston, Birmingham, into the motor cycle world.

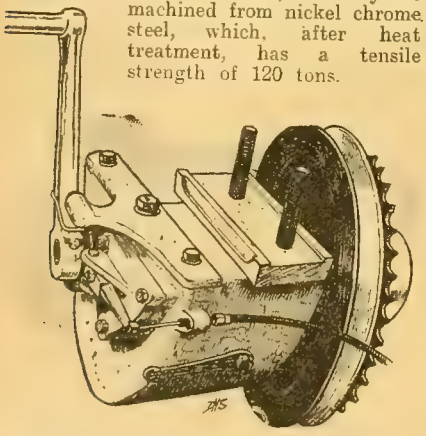
Naturally, they are specialising on a gear unit, a component which they are in an admirable position to produce. The gear is a lightweight two-speed box, with clutch and kick starter, suitable for use with single-cylinder engines up to 2¾ h.p. or multi-cylinder engines of 4 h.p., and it is capable of transmitting the drive of a 3 h.p. sidecar outfit.

In the designing of a two-speed countershaft gear it is extremely difficult to depart from an orthodox layout, and the makers in this case have not in any way endeavoured to seek departures from standard practice in the mere effort to be unconventional.

Orthodox Practice Followed.

In general appearance the Moss gear box follows closely the lines which have been made familiar by various proprietary gear boxes of similar specification.

The gears themselves are carried in a one-piece aluminium casting, all the parts being inserted for assembly through the main bearing housing behind the pulley, while the kick starter mechanism is introduced through a detachable cover plate on the top of an integrally cast extension on the right-hand side. The gears are in constant mesh, and they are machined from nickel chrome steel, which, after heat treatment, has a tensile strength of 120 tons.



The Moss gear box for lightweight machines; the simple kick-starter arrester and clutch operation are clearly shown.

The gear teeth are of the stub form, a type in which the Moss Gear Co. specialise. This form of tooth gives great strength, and is silent in action. The gears are engaged by a double dog clutch on splines formed upon the case-hardened mainshaft. In this connection it is interesting to note that the bore of the clutch dog, and indeed all other splined or spiral bores in the moving parts, is bonded; the machining process gives very accurate results, and permits absolute interchangeability of all parts so produced. The free end movement of the double dog, for example, is not allied with any shake or backlash,

As can be seen, the Moss gear can be easily fitted without alteration to standard frames. A convenient operating lever is mounted beside the tank.

a result due entirely to the use of this method.

The clutch is of very simple construction, and is mounted upon the end of the mainshaft in the ordinary manner, and the drive from the engine is transmitted to the 40T half-inch pitch chain wheel which runs upon a single-row ball bearing; the outer clutch plate is pressed up against the cork inserts carried in the chain wheel through the medium of a large diameter coil spring of rectangular section.

Perhaps the greatest departure from accepted practice is to be observed in the kick starter parts. The starting apparatus consists of two wheels in constant mesh, one of these being rigidly fixed on a squared extension of the mainshaft; the other, which has internally-cut ratchet teeth, runs upon an enlarged portion of the pedal spindle. This enlarged portion is pierced diametrically by a squared hole in which slides a spring-loaded plunger of high tensile steel. When the pedal is returned by its spring to the inoperative position, the plunger strikes against a cam which forms part of the spindle bush, and is, in consequence, depressed, so that its end does not project above the outside of the spindle. When the starting pedal is rotated, however, the plunger is free to move outwardly under the agency of its spring, and the specially shaped end engages with the ratchet teeth of the starting pinion.

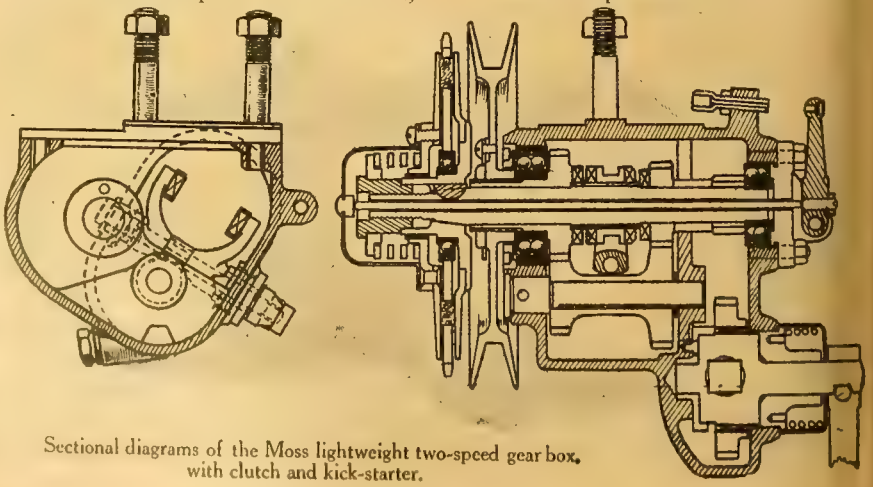
In all respects the Moss gear box conforms to standard practice in the matter of frame attachments, chain and belt lines, and standard gear box brackets may be used to support it.

As may be expected in a product coming from a firm with so much experience in the manufacture of high-class gears for motor cars, no attempt has been made to produce an ultra-cheap unit. Rather, the effort has been to manufacture a gear box embodying the best that is possible alike in design, workmanship, and material.

Visible Control.

A word must be added with regard to the gear change mechanism. The designers have arrived at the conclusion that it is preferable to have the gear change of such construction that the position of the gear lever shall be readily seen, and in consequence a control lever is mounted alongside the tank.

The gear change is remarkably easy, and on a test machine which we tried we were able to change gear from high to low and back again repeatedly without using either clutch or exhaust lifter, even while the engine was pulling under considerable load. Such a result is indeed excellent, as it follows that if the box will stand such treatment it is hardly likely that it will suffer in the hands of the most inexperienced novice.



Sectional diagrams of the Moss lightweight two-speed gear box, with clutch and kick-starter.

A PASSENGER MACHINE FOR £1.

MY reminiscences have moved Mr. H. Wilson, of West Bromwich, to send us the accompanying photograph of an old Bollée three-wheeler, which he purchased for a sovereign last summer, and drove in the West Bromwich peace pageant, winning a prize of £5 for the turnout. It is rigged up as a skit upon a local 'bus service which is not renowned for speed or reliability. The machine has not been put into daily use, as it suffers from various defects of construction and design, but it behaved nobly in the pageant, and the fact that it shed its exhaust pipe on the great day only added to the fun. There is no accommodation for the feet of the two passengers occupying the front seats, and they are apparently intended to place their boots in the driver's lap. Braking is primitive; the belt pulley is slid forward into contact with a fixed brake block, whilst the second brake is a spoon digging into the tyre in the direction of rotation. The joy-stick must be operated with restraint, or it may throw the passengers out. The flywheel must be removed in order to adjust the contact breaker. The exhaust valve rocker measures 2ft. 6in. long. The vibration is so terrific that rusty nuts, which had defied the application of a blowlamp, literally flew off when once the engine was started up.

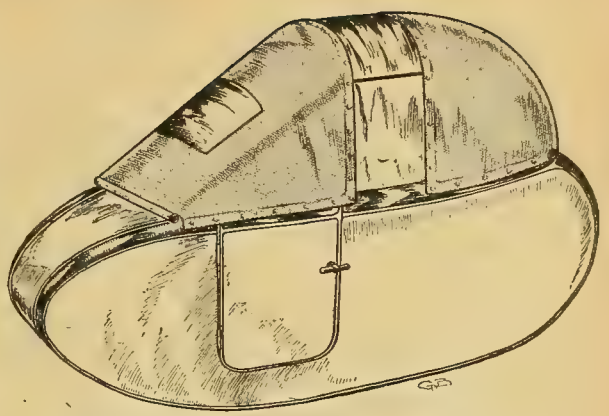
Hardly a "No-trouble Mount."

In the peace procession the control of the machine kept Mr. Wilson's hands well occupied. The throttle rod snapped, so the driver jammed the throttle open, and began to control the machine on the ignition switch. This led to severe pre-ignition, after which the inlet valve was used, as its stem protruded accessibly. After two miles, rust inside the petrol tank caused carburetter starvation, and thence to the finish one of the passengers kept on priming the engine by squirting petrol into the inlet valve—an exciting job. Skidding defies description, and Mr. Wilson has not yet dared to change up on to high gear, as the steering is geared so low that he cannot turn the handle fast enough to correct the gyrations. Towards the end of the procession the main bearing cap fell off one end of the crankshaft, which is suspended from the side members of the frame, and the shaft kept bumping against the chassis, but did not object to this rough treatment.

Mr. Wilson, whose address is 39, Bull Street, West Bromwich, would be interested to hear the date of manufacture, original list price, and whether any engineering museum would care to house his tandem.

It certainly has earned an honourable resting place for the remainder of its days.

IXION.



The latest Easting screen patent which will interest, among others, sidecar passengers who intend to participate in the London-Exeter run.

TO CONVERT SIDECARS INTO COUPES.

MR. C. A. EASTING'S name is now a household word among sidecar owners and passengers, therefore any forecast of future activities as revealed by the patent files is of interest to all who study the question of sidecar comfort.

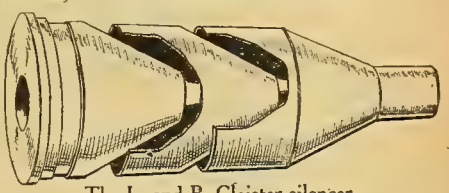
The combined hood and screen illustrated is the subject of a patent filed twelve months or more ago that has only recently been completed, otherwise one would be justified in thinking that Mr. Easting and his co-designer, Mr. P. Pridmore-Hill, had been inspired by road faring experiences this summer.

As will be seen from the illustration, the new device consists chiefly of an ordinary Easting windscreen, placed vertically and having a small window in the apron. Extending from the rear edge of the screen there is a hood which completely encloses the passenger, thus turning an open body into a coupé.

A SILENCER TO MINIMISE BACK PRESSURE.

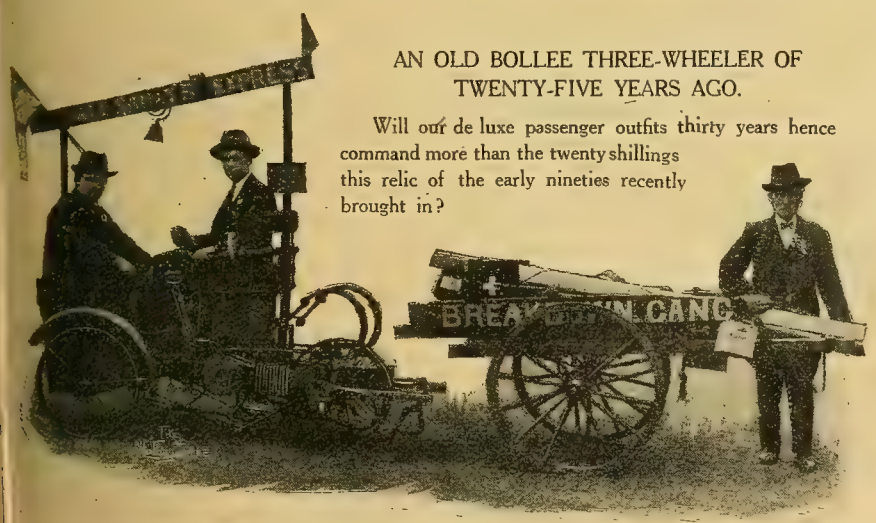
THE numerous attempts that have been made from time to time to design a silencer which will effectively reduce the noise of the exhaust gases, and at the same time permit their unobstructed exit without causing back pressure have, as a general rule, proved unsuccessful.

A novel type of silencer which has been marketed by Messrs. Walker and Gordon, Ltd., 12-13, Henrietta Street, Strand, London, W.C.2, has introduced the principle of the megaphone, but, of course, in this instance its action has been reversed. A number of cones are placed at equidistant points inside the cylindrical case. The gases pass through the base or wide diameter ends of the cones, and pass out of a hole, slightly smaller in diameter than the exhaust pipe, cut in the apex of the cones. The reduction in diameter of the small holes is one-sixteenth of an inch less than that of the exhaust pipe, and has been found to restrict the noise sufficiently.



The L. and B. Cloister silencer.

It is maintained that back pressure is very low with this silencer: but even an open exhaust pipe is not entirely free from this defect.



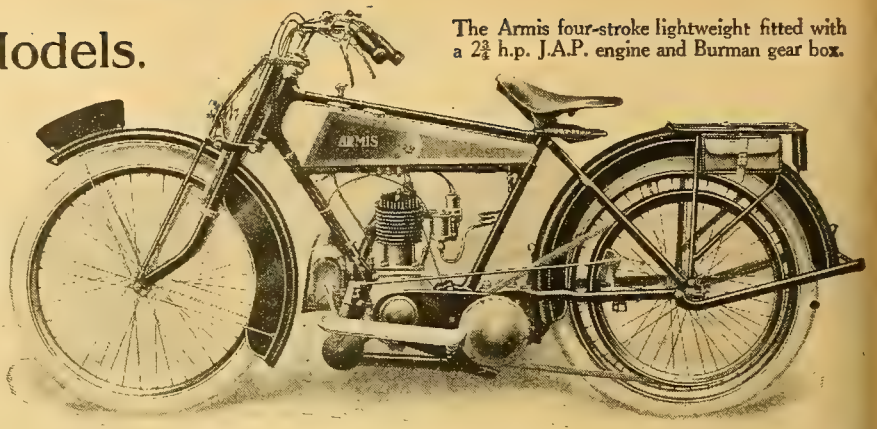
AN OLD BOLLEE THREE-WHEELER OF TWENTY-FIVE YEARS AGO.

Will our de luxe passenger outfits thirty years hence command more than the twenty shillings this relic of the early nineties recently brought in?

A new model of the Ideal pillion seat, which has a combined air and spring cushion. It is made by the Coventry Ideal Pillion Seat Co., of St. Michael's Road, Stoke, Coventry, and costs £2.

New Armis Models.

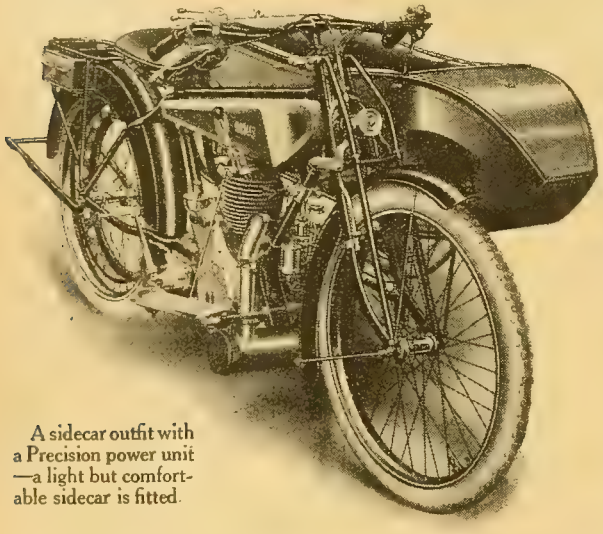
A Lightweight Sidecar Outfit and a Solo Mount.



The Armis four-stroke lightweight fitted with a 2¾ h.p. J.A.P. engine and Burman gear box.

AMONG the several new makes introduced since the revival of the motor cycle industry after the war, the Armis, made by the Armis Cycle Manufacturing Co., of Heneage Street, Birmingham, is not the least known. It entered the market unostentatiously and with a modest output, which has gradually increased so that this year quite a creditable number are on the roads and giving satisfaction.

The first model introduced was a neat solo machine with a Precision 350 c.c. two-stroke engine, sloping top tube frame, 26×2¼in. tyres, Burman two-speed gear box with clutch and kick-starter, Saxon forks and usual first class equipment sells at £85.



A sidecar outfit with a Precision power unit—a light but comfortable sidecar is fitted.

Two more models have now been introduced, and a third, of 5 h.p., will follow by the time the Show opens. The first of these is a runabout sidecar outfit consisting of the Precision-engined machine and a light but exceedingly neat sidecar of the type known as "semi-sporting," but which is quite comcomfortable, has a side door and a convenient rear locker. The price of the complete outfit is £115.

Probably next year quite a large number of machines of this type will be in use as sidecar machines, as they fill all the requirements of many who are content with a moderate speed, and do not require a machine for heavy loads.

Second in the range is a J.A.P.-engined machine on the lines of the two-stroke, and also fitted with a Burman gear box and equipment as mentioned above. It makes an attractive little mount, which should appeal to those who require a handy solo machine and prefer the four-stroke engine. Like the two-stroke, it is a comfortable machine to ride, being well balanced and affording a low riding position.

A Dual-purpose Mount.

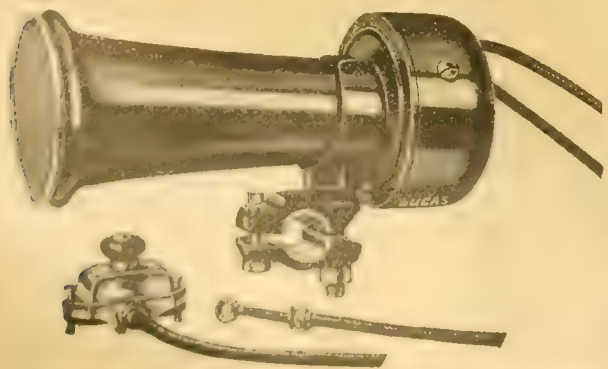
Of the third model, we are not at liberty to say much at the present time, but it will be of a type which next year will be popular for both solo and sidecar use, being eminently suitable for both purposes.

From what we know of the experimental machine it seems to strike a new note in external design.

A LUCAS ELECTRIC HORN.

An Additional Fitting to Complete the Magdyno Outfit for 1921.

DURING this year the Lucas Magdyno, which combines the high-tension magneto and a six volt dynamo in one machine, has given every satisfaction in the hands of both competition riders and those private individuals who have been fortunate enough to possess the equipment.



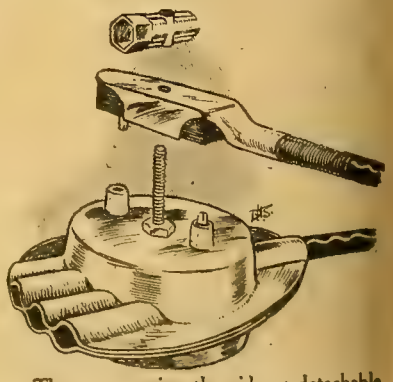
A new electric horn for use either with the Lucas Magdyno outfit or with a separate six-volt battery.

Indeed, so successful has been the results of continued usage that no alterations are meditated for next year's production, which will be on a larger scale than heretofore. The only item needed to make the set complete in the past has been a suitable electric horn, and this omission has now been rectified—an excellent warning signal of the usual Lucas quality and appearance now being available. Provision for the horn connections are provided on the usual junction box, and a very neat handle-bar switch.

The mechanism of the horn is strong and substantial, and is readily accessible for adjustment of the contact screws should this become necessary. A large condenser, however, connected across the contacts should eliminate any undue sparking and wear while the horn is in operation.

A little refinement has been added to the detachable plug of the junction box, which is arranged for conveniently separating the wiring when detaching the sidecar. In the 1920 models the plug was secured by a finger nut, but this will be replaced by a special form of nut which embodies a hexagon box key fitting the terminal nuts inside the junction box itself.

A fully illustrated description of the Magdyno appeared in the issue of *The Motor Cycle* dated October 30th, 1919, when the internal construction was explained.



The nut securing the sidecar detachable plug forms a box-key for the terminal nuts in the junction box of the Magdyno wiring system.

A Sporting One-day Trial on Surrey Hills.

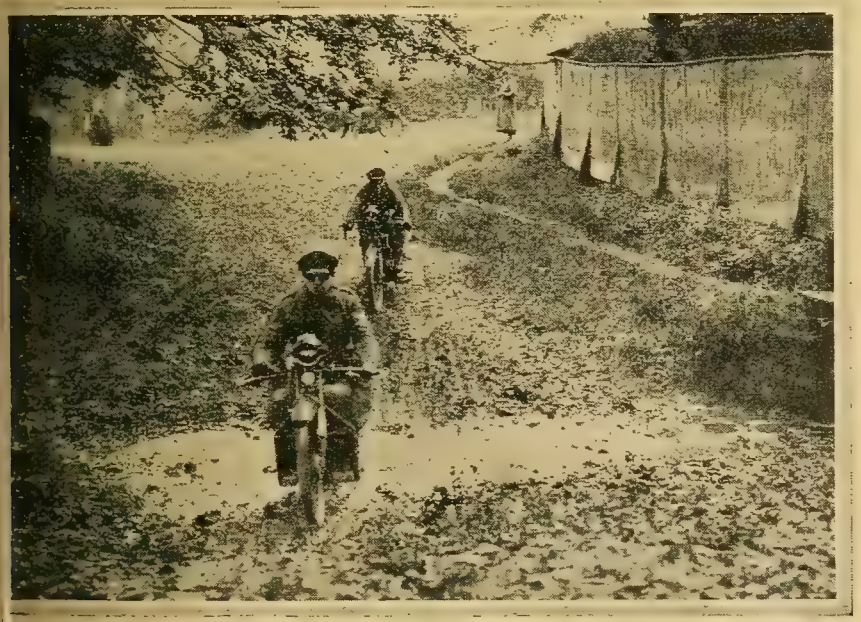
Knock-out Trial for Members of the Motor Cycling Club.

PEOPLE have often expressed their opinion that the Motor Cycling Club's trials have been too easy in the past, and not without reason.

Saturday's course, however, was by no means an easy one; sporting it certainly was, but there were few sections indeed where the going was good, while the condition of the roads added to the difficulties. Had the surfaces been dry, there would probably have been a fair percentage of gold medals, but they were very much the reverse. Starting at Purley Corner, Mr. F. T. Bidlake was, as usual, the timekeeper; and at 10.1 a.m. he walked down the line of eighty-one entrants, sending off each man one minute after his predecessor. The marshalling was ably carried out by Messrs. W. H. Wells, W. Cooper, and W. Albert. The men who chiefly mapped out the course were Vivian Olsson, who started first on a 7 h.p. Indian, and Ernest Bridgman, who was responsible for the arrowing. So intricate and difficult was the course that any failure in the direction signs would have led to appalling confusion, and the whole success of the trial depended on the efficiency of the marking. However, the arrowing was excellent, and there were also blue powder marks on the road, so that no one could go astray. Olsson started with assistance, while the two Bashalls, mounting Martinsyde twins, glided silently away on their clutches. F. Applebee, senr., was there riding a Levis fitted with his famous T.T. engine. The last man to leave was Rex Mundy on a Coulson B (No. 81), who did not figure in the programme owing to the late arrival of his entry. There was one very interesting machine at the start—a 2¾ h.p. flat twin Levis, fitted with two C.A.V. magnetos driven by a single chain, a Burman two-speed gear box, and very efficient mudguards.

A "road" chosen by the M.C.C. for their sporting one-day trial last Saturday.

After a short spin down the main Eastbourne road, the course turned left and ascended by a long easy rise to the back of Upper Warlingham. Then through leafy lanes with overhanging trees to Cudham Church Hill, up Salt Box Hill, then over what was described as a piece of real Colonial road known as Sunningdale Avenue. Among the unfortunates at this point were Love (Douglas), Longman (Wooler), Clennell (Blackburne), and Spikins (Harley-Davidson), who ran off the course, while Cowlin (P. and M.) fell. Watson (Harley-Davidson) came up too fast and failed. Other failures were Driscoll (Indian) and Huggins (Zenith).



At the foot of Chalk Pit Hill competitors had to negotiate this watersplash. Only three entrants claimed non-stops throughout this section.

Appalling Surfaces.

But all this was child's play compared with what was to come. The *pièce de résistance* of the morning, if not of the whole day, was Chalk Pit Hill, the old coach road which runs parallel with Pitsey Hill proper. It was approached by a water splash, which in itself was not terrifying, then came grease and then more grease, deep, sticky and skidsome. This at the bottom; but from the summit downwards things were not quite so bad. First there was a gradient of about 1 in 5 on a fair surface, then many leaves which hid deep ruts, then more ruts, and finally the conditions just described. Olsson arrived wrestling with his big Indian. The appalling surface and the absence of a handle-bar clutch control were his undoing. Near him was Morgan on a Harley-Davidson, then Spikins on a similar machine was also in trouble. It was clearly a hill on which the heavier mounts were at disadvantage. Some of the lightweights put up a good deal better performances than their heavier brethren, but clean ascents were few and far between. As they passed us the two Martinsydes, ridden by the brothers Bashall, were travelling well and were most skilfully ridden, but the riders had their feet on the ground, as also had everyone else on that treacherous surface, on which it was difficult enough even to stand. Most of the riders skidded from one rut into another, or at times right across the road.

Below this point where the gradient really began, there came a sharp corner with a surface of semi-fluid slime. Pluckily the competitors tackled this

A Sporting One-day Trial on Surrey Hills.—sector and nearly all skidded into one particular spot on the near side of the road. At this stage, when the observers' reports have not all been handed in, it is impossible to say definitely who made clean ascents, but so far as can be ascertained at present Ammon (Metro-Tyler) climbed the hill successfully. He rode with extreme skill, keeping his engine running just fast enough to drive. Gayford (Zenith) also claims a successful climb, while Carey (Harley-Davidson) claimed a stoppage through traffic. A Triumph, ridden by Staunton, was also stated to have got up. According to the rules, riders were allowed to claim clean ascents provided they did not stop their road wheels or leave their saddles, so foot slogging or trailing the feet on the ground did not count against a competitor.

After the terrors of Chalk Pit there was nothing serious before lunch. By lunch time at Reigate the ranks of the competitors had been sadly thinned, and many of the late arrivals had actually retired. The course doubled back on itself, twisted, turned, and wound about in a manner which baffles description. There has been only one like it before, and that was the course used for the last Arbuthnot Trophy Trial, which served as a model for Saturday's event.

After lunch the main Reigate road was followed to the turning to Pebblecombe, when a turn to the right was taken leading up this famous hill, which nowadays causes little trouble.

Gorgeous Scenery.

Next followed the descent into Little Switzerland; then Juniper Hill accounted for very many failures. An ascent through woods on "colonial lines," where the humour of an S.O. (straight on) notice was keenly felt by Applebee, since few could keep on and no one could keep straight. Then to Dorking, up to Leith Hill, by the back way and over a mountain track, all through Surrey's most gorgeous scenery, finishing with Bright's Hill, Guildford, and the run back to Ripley, where tea was taken by the survivors.

The ascent over Leith hill was worth watching; the course suddenly left the main road by some cottages and went straight up the hill side. The ruts and gulleys had been filled with sand-stone, and to dodge them necessitated swinging from one side of the track to the other. Consequently, the riding could hardly be described as pretty. There were, however, few failures. The Brothers Bashall, as usual, handled their Martinsydes very skilfully, and came up well; good ascents were also made by Morgan and Spikins (Harley-Davidsons), both smiling; Reyre (A.B.C.) scattering his tools as he rode; Boyer (8 Rover), Whithy (Triumph), Tilt (Triumph), Battley (Triumph), Dunford (Verus), F. W. Applebee (Levis), Bourlet (Ariel), Gotley (Omega), Roberts (A.B.C.), Ammon (Metro Tyler), Carey (Harley-Davidson), Aitken (Indian), Clennell (Blackburne), Barclay (Reading Standard), Julian (A.B.C.), Labin (Indian Scout), Tait (Harley-Davidson), Gayford (Zenith), and Bennet (Metro-Tyler). Bright's Hill, Guildford, accounted for very few failures, but it defeated Reyre (A.B.C.), who had been travelling fifteen miles on one cylinder, while Bourlet's Ariel shed its belt.

At the end of the trial only three competitors claimed non-stop runs, J. T Bashall (Martinsyde), Staunton (Triumph), and Gayford (Zenith).

CLUB NEWS. (Continued from page 475.)

Berwick and District M.C.

The results of the recent reliability run to Edinburgh are now to hand: 1 (club gold medal), W. Skelley (3½ Lea-Francis); 2 (club silver medal), W. H. Dodds (2¾ A.J.S.); 3 (club bronze medal), W. Murray (3½ Sunbeam).

Cambridge University M.C.C.

A one-day reliability trial will be held on October 24th, starting from Barton Road, Cambridge, at 9 a.m. This will be the first event of an interesting programme arranged for the present term. Any members of the University wishing to join the club are requested to communicate with the hon. secretary, C.U.M.C.C., 28, Malcolm Street, Cambridge.

Cardigan and District M.C. and L.C.C.

Somewhat unfavourable weather conditions for such an event, a strong head wind and driving rain, prevented any very sensational times at the speed trials recently held on the Crymmych-Pentregalar road. However, as the course was threequarters of a mile long, the fastest time (45⅘s.), made by J. George (3½ Sunbeam), works out at nearly 60 m.p.h. The results were:

[illegible] -1, E. Griffiths (2½ Sun-Villiers), 1m. [illegible]; 2, A. Jones (2½ Royal Enfield), 1m. 40⅘s.; 3, R. E. Thomas (2½ Velo), 1m. 47⅘s.

[illegible] -1, Dr. Cave (2½ Douglas), 1m. 21s.; 2, D. Stephens (2½ Douglas), 1m. 30⅘s.; 3, O. Jones (Omega), 1m. 44s.

[illegible] -1, J. George (3½ Sunbeam), 45⅘s.; 2, [illegible] E. O. Evans (2½ Rover) and D. J. [illegible] Norton, 56s.

[illegible] -1, M. Davies (3½ Sunbeam), [illegible] D. J. [illegible] (7 Norton), 54⅘s.; 3, E. O. [illegible]

[illegible] M. Davies (3½ Sunbeam), 49⅘s.; [illegible] 56s., 3, D. J. Jones (3½

Bradford M.C. and L.C.C.

The first of a series of winter lectures will take place on Thursday, October 28th, after a general meeting at the club headquarters, when Mr. E. W. Stanfield will speak on "Magnetos and Magdynos."

The detailed final results of the recent hill-climb and speed trial on handicap are now to hand, and are as follows:

HANDICAP HILL-CLIMB, TONG HILL, NEAR BRADFORD.

SOLO.—1 (gold medal), J. C. Neilson (7-9 Harley), 7 sec.; 2 (silver medal), R. T. Cawthorne (7-9 Indian), scratch; 3 (bronze medal), R. W. Stanfield (3⅘ Scott), 4 sec.

SIDECARS.—1 (gold medal), G. Townsend (3½ P. & M. sc.), 12 sec.; 2 (silver medal), R. T. Cawthorne (7-9 Indian), scratch; 3 (bronze medal), C. Sidney (3 A.B.C. sc.), 17 sec.

DYSON SHIELD (competed for by winners of Solo and Sidecar Classes).—J. C. Neilson (7-9 Harley), solo, scratch, beat G. Townsend (3½ P. & M. sc.). 14⅘ sec. Won by ten yards.

SPEED TRIALS AT PENNY POT LANE, NEAR HARROGATE.

SOLO.—1 (gold medal), W. Drake (3½ P. & M.), time 18 sec. = 66.6 m.p.h.; 2 (silver medal), W. Baines (3½ P. & M.), time 20 sec. = 60.0 m.p.h.; 3 (bronze medal), R. Rushworth (3 A.B.C.), time 18 sec. = 66.6 m.p.h.

FASTEST TIME.—Gold medal: H. O. Wood (3⅘ Scott) time 17⅘ sec. = 68.2 m.p.h.

SIDECARS.—1 (gold medal), S. Lockwood (4 Triumph sc.), time 24⅘ sec. = 48.7 m.p.h.; 2 (silver medal), G. Townsend (3½ P. & M. sc.), time 23⅘ sec. = 50.8 m.p.h.; 3 (bronze medal), S. Haigh (6 Ariel sc.), time 26⅘ sec. = 44.7 m.p.h.

FASTEST TIME.—Gold medal: G. Townsend (3½ P. & M. sc.), time 23⅘ sec. = 50.8 m.p.h.

Glasgow Western M.C.C.

The Western Motor Cycling Club, Glasgow, held its final trial of the year on Saturday, this being a fifty miles non-stop speed-judging competition for the Bates Trophy, presented by Messrs. W. and A. Bates, Ltd. Competitors were set to cover a course of fifty miles non-stop at a scheduled speed of 20 m.p.h. without the aid of a speedometer, watch, or other recording instrument. The Bates Trophy was awarded to the rider covering the course non-stop with the smallest aggregate time error at the three secret checks, and prizes were also awarded to the three riders next in order of merit. The competition proved a popular one, and provided a most enjoyable afternoon's sport. It is interesting to note that, without exception, the riders underestimated their speed, the total time errors varying from 5½ mins. to 18 mins. Results: 1, Bates Trophy and gold medal, D. S. Alexander (8 Enfield sc.)—total time error, 5m. 44⅕s.; 2, J. Littlewood (6 A.J.S. sc.), 6m. 55⅘s.; 3, G. Hope Wilson (7-9 Indian sc.), 7m. 8⅖s.; 4, R. A. Law (3½ Rudge), 7m. 12s.

Bedford and District M.C.

The Bedford and District Motor Club are organising a non-stop reliability trial, to take place on Thursday, October 21st, over a circuitous course of about ninety miles with easy reach of Bedford. The following trophies are being put up for competition: The Lindley shield, for the best team performance, and club's medal to each member of the winning team; the Thurburn cup and club's miniature for the best individual performance; and the Berrie cup (to be won outright) for the best performance on the oldest machine.

The competition is open to club members only, and new members wishing to join for this event will be entitled to full membership next season without payment of additional subscription.

The start will take place at 1.45 p.m. from St. Peter's Street, Bedford. Further particulars from Mr. F. Luddington, 131, Midland Road, Bedford.

Southampton and District M.C.

The Southampton Motor Cycle Club held a very successful inter-club hill-climb on Saturday, October 16th, at West Dean Hill, near Whiteparish, Hants. The hill was in a very bad condition owing to the heavy rains during the week. The results, on time only, are as follows:

CLASS 1 (350 c.c.).—1, D. Robertson (2¾ Douglas), 2m 5⅖s.; 2, R. A. Beazley (2¾ Douglas), 2m. 6⅕s.; 3, E. C. Prince (2¾ Douglas), 2m. 13⅕s.

CLASS 2 (UNLIMITED).—1, — Chawner (3½ Sunbeam), 1m. 43⅖s.; 2, R. A. Beazley (7-9 Indian), 1m. 44⅖s.

CLASS 3 (PASSENGER MACHINES).—1, L. A. Apsey (8 Royal Ruby), 1m. 52⅕s.; 2, D. B. Ware (4 Norton), 2m. 20s.; 3, B. B. Tebbutt (10 Morgan), 2m. 26⅕s.

Still more Brooklands successes!

The season draws to a close, but still each week brings its quota of successes on Palmer Cord Tyres. We shall have a long season's list by the time the show is here. Meanwhile, note—

B.M.C.R.C. Championship Meeting, Oct. 9th.

10 Mile Record—Classes C. & D.

1st in Ten Mile Race for Solos up to 500 c.c.

Also 3 Seconds and 3 Thirds in Ten Mile Championship Race.

THE FINEST LIGHT CAR IN THE WORLD

The Richardson

IMMEDIATE DELIVERY.

SPORTING 2-3 SEATER

LIGHT CAR

ECONOMY THE ORDER OF THE DAY

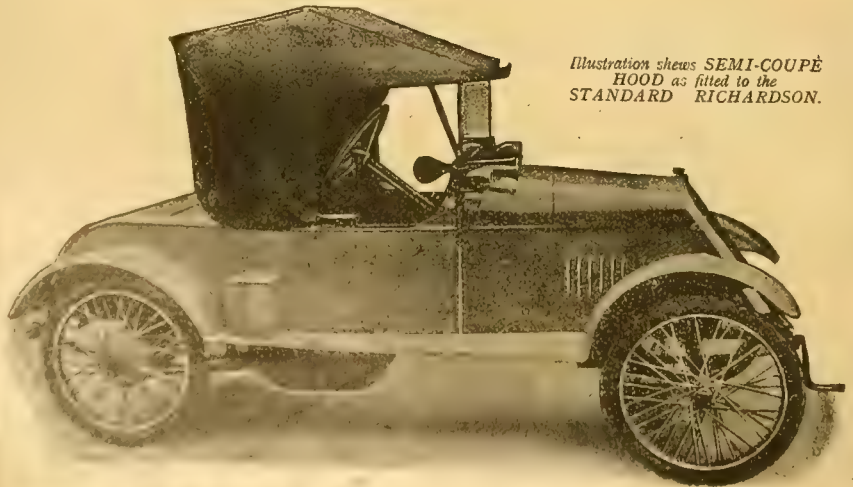

Illustration shews SEMI-COUPÈ HOOD as fitted to the STANDARD RICHARDSON.

The Richardson Light Car

Is the most economical car of its kind upon the market, as the following points will show—

1st Its First Cost is Low, £262-10-0.
2nd Tax is Low.
3rd Running Costs are Low, averaging only ¾d. per mile on petrol.

The cost of upkeep is low, for instance, owing to the extreme lightness of the car, the tyres will do 10,000 miles.

So, if you want the ECONOMY CAR, PLUMP FOR A RICHARDSON.

SOME RICHARDSON RECORDS.

1. **Cumberland Trials.** 140 miles of the stiffest roads in Cumberland, including **Red Bank, Foolstep, and Kirkstone Pass. Three Standard Richardson Cars entered, and finished on time.**
2. **York-Edinbro'-York Reliability Trials.** 400 miles in 22 hours, including stops for meals. **Two Standard Richardson Cars entered, and completed course on time, winning Special Silver Cup and Medal.**
3. **Sutton Bank Hill-climbing Test.** Almost a mile with gradients 1 in 3. **Three Standard Richardson Cars entered and completed the Climb,** averaging 3½ minutes.
4. **J.C.C. Northern Reliability Trial — Stockport, Buxton and District** —severe hill-climbing tests. **One Standard Richardson Car entered and won Gold Medal.**

Over-production?

SPEAKING in the House last week on the question of the proposed datum line for coal output, Mr. Brace, the miners' leader, contended that much unemployment in this country was due to over-production. He specifically mentioned the motor trade of Coventry as an example. With the basis of Mr. Brace's remarks the policy of this paper is not concerned, but when he particularises on the subject of the motor industry it is time to enquire into the accuracy of his statements.

Has the motor cycle industry suffered from over-production? Surely the vast number of imported motor cycles provides a convincing answer! In the month ending September, 1920, motor cycles and parts to the value of £22,774 were brought into the country, and the figure for the nine months preceding that date was no less than £343,712. These imports have taken place in order to supply the demands of British riders, whose requirements have not been satisfied by home manufacturers. Foreign machines are not always imported because riders actually prefer them to the home-produced article, but largely because they have been unable to obtain prompt delivery of British machines at a reasonable figure. In addition to this, there is an enormous and unsatisfied demand for British machines in Overseas markets. This demand is being fulfilled chiefly by American manufacturers, but there is evidence that buyers in many cases prefer our products.

What, then, is the cause of the temporary slump, if slump there be? Partly it is due to the normal slackening of orders at this time of the year, coupled with the high cost of living, but mainly it is due to the high prices demanded for motor cycles. Surely it must be obvious that, with given overhead charges, the greater the output the lower the cost per machine, since these charges can be distributed over a greater number of machines. Therefore, it would seem that the remedy lies in *increased* production.

Taxation Favours Lightweights.

MOTOR cycles next year will be divided into two classes for taxation purposes, *i.e.*, those below and those above 200 lb. in weight. The time has come, therefore, when approximate catalogue weights will fail to serve a useful purpose. In the past there has been a certain amount of laxity on this point, and one could never be sure whether the weight quoted by a maker was arrived at by means of a weighing machine or a vague calculation on the part of the catalogue compiler. Instances have occurred in which machines given as weighing 230 lb. have been actually as much as 20% higher. Such wide differences between the printed and actual figures are sufficient to cause the purchaser justifiable disappointment, and next year the difference of a few pounds, when the machine weighs something in the neighbourhood of 200 lb., will represent to the owner a matter of 30s., one way or the other.

Undoubtedly the choice of a certain number of purchasers will be in favour of the motor cycle subjected to the lower taxation, and it behoves makers of machines under, but near, 200 lb. in weight to take more than ordinary care to ensure that such buyers obtain what they require, *i.e.*, a machine on which only a 30s. tax is demanded.

It will not be sufficient for a maker to weigh the first sample machine and take it for granted that all the production models are of the same weight.

At the present time there are quite a number of machines near the dividing line, and consequently the next taxes may have some influence in inducing manufacturers to reduce weights. Properly carried out this will be all to the good, as of recent years the tendency has been to overlook the most attractive feature of the small solo machine—its low weight. Everything else being equal, the lighter machine is bound to be the more economical, and economy should be the keynote of every design.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

By Ixion.

Two 1911 Machines.

THE other-day business took me into one of the hilliest counties in England, where I presently foregathered with two riders of 1911 machines—a Rudge and a Triumph respectively. Ancient memories revived as I handled these aged crocks, as the modern knut would doubtless stigmatise them. The main impression they made upon me was that of an extraordinary lightness—both felt much more like babies than 500 c.c. machines. The Rudge had an N.S.U. gear, but the Triumph was still fitted with single fixed gear; both machines are accustomed to tackle anything short of an A.C.U. freak hill, and as far as I can judge, their climbing is better than that of a modern 500 c.c. on its top gear. They look quaint and have grown very shabby, but they are fine goers still. Neither of them has required any major replacements in ten years of hard service, and the original cost of each was some £50. Cheap transport, gentlemen.

The Solo Windscreen.

TWO firms were advertising windscreens for solo machines in the last issue of *The Motor Cycle*. I tried a home-made gadget of this type many years ago, and experienced a lot of trouble in making it sit up at the correct angle against head winds, especially when I was speeding. It is, I suppose, a logical adjunct to the leg shields which many all-weather riders now fit, but it stands in quite a different category from the car windscreen. When you are seated in a deep coach-built body with a good screen ahead of you, you can keep both dry and warm at speed in any weather. On a motor cycle you must trust your clothing, and not any gadgets carried on the machine, for warmth and dryness. Whether you carry a wind-[illegible] net, you must wear good, thick, waterproof [illegible]. To my mind the windscreen offers two [illegible]. Its chief merit is that if its dimensions are correct, it protects that vulnerable gap between the coat and the chin, and prevents spindrift from [illegible] down the front of your neck. Its other value is that if you are butting into an ice-edged nor'-easter on a dry day, your face need not get frost-bitten. So long as you don't expect it to keep your whole body dry and warm, it is fine. I am not sure that the best motor cycling windscreen is not one of those towel things which Eastern women tie round the lower three-quarters of the faces; I once met a rider wearing such a contraption on a snowy day, and whilst I deplored his appearance, I envied the comfort he was enjoying. My own face was frozen stiff, and all my underclothing was positively slushy.

The Comfortable Sidecar.

I CANNOT remember ever having seen it admitted in print that a really first-class sidecar is probably the most comfortable seat, bar none, in the whole gamut of road travel. Many a rider proudly makes the transit from a combination to a cycle car or even a light car, only to find that his wife or sweetheart hankers sadly after the superior suspension of the sidecar. The comfort of both cycle cars and light cars varies enormously. A few of the very best are excellent. One or two of the worst ride as coarsely over pot holes as a rigid-framed bicycle with a fifth-raté fork. The average experience of the sidecar couple who promote themselves to a cycle car is that the driver gains little in comfort, and that the lady loses a lot. If the change is to a light car, everything depends on the make, but the lady is not likely to score much by the change in suspension, though the driver may relish his new experience, quite apart from weather protection. I fancy not the least reason for the vogue of the combination is that the occupant of the sidecar rides as comfortably as anybody on the road.

Instrument Lamps for Motor Cyclists.

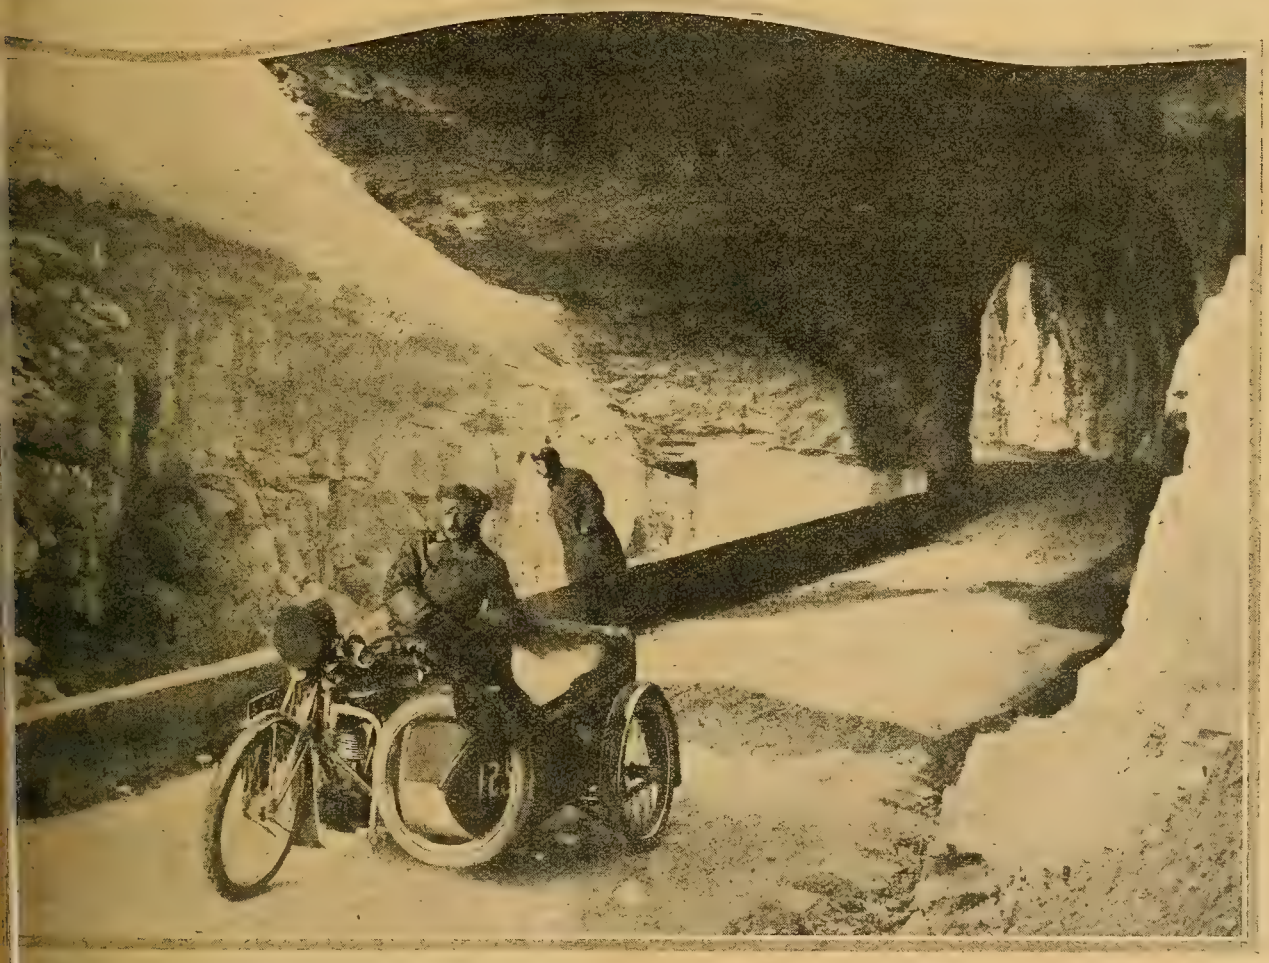
I HAVE received an enquiry for a bijou handle-bar acetylene lamp from a night rider, who wants to illuminate his speedometer and oil drip. The distractions and monotony of long-distance work must doubtedly tempt the traveller to forget about his lubrication, and when no reminders are visible, the rider is quite liable to sink into a subconscious condition, as every "Twenty-four" medal winner knows. I replied with the suggestion of a dry battery gadget. My own experience of low capacity acetylene burners is not gratifying, and many riders prefer to run acetylene tail lamps off a tiny separate generator. Has any reader lore to distil on the subject of instrument lamps for prolonged night work?

The Problem Simplified?

THERE was every excuse for hand pump oiling so long as our engines had plain bearings of somewhat inadequate area, and their cylinders and pistons were specially designed to distort as much as possible. But it was distinctly disappointing to find the old-fashioned type of oiling perpetuated on a *fin de siècle* 'bus like the A.B.C. with not an oil-thirsty bearing in the engine, with symmetrical cylinders of even wall thickness, and pistons developed from aero engine practice. I believe Mr. Bradshaw's original design included sump oiling, and it would be interesting to hear what snags his testers struck in a system for which most lazy riders continue to sigh. A cynic of my acquaintance avers that there is an unholy alliance between engine designers and sparking plug manufacturers in this matter, the idea being to compel the clumsy owner to buy a fresh plug once a month; but I cannot swallow this foul libel. Meanwhile, I plaintively proclaim my ideal. A colleague on the staff of *The Autocar* lives on board a small, cheap car. He has an oil indicator on his dash, but it never works, and never has worked. He never buys any oil by the roadside. He never carries any oil (outside his engine, *bien entendu*). He never thinks about oil, except at the monthly go-over-everything. He never carries a spare plug. He never cleans his plugs. He never buys any plugs. I envy him. There are four seven-and-sixpenny plugs waiting on my desk now. All of them are charred and blackened. I shall get myself into a filthy mess scraping them. Next month they will want scraping all over again. Such is life. Incidentally most of my small engines consume more oil than his large engine per 1,000 miles.

A Needle Wanted.

HAVING lost three tool-rolls this season I have just had a brain-wave, and sewn one end of my tool-roll firmly to the lower inside corner of its pannier bag. If another fastener should jolt open under the combined inducement of my average speed and our vile roads, I stand a fair chance of saving some of my tools. Instead of the tool-roll hurtling like one thing into the heather in malicious silence, the roll will hang down and flap against my chain case; and the odds are I shall hear in time to recover some of the equipment. Of course, it *may* get taggled up in the spokes of the back wheel; but I shall risk that. I commend this very simple tip to the trade. Oddly enough, I do not think I have shed a bolt or a nut all the year. Most of my riding has been done on Scott, Norton, A.B.C., and B.S.A. machines, all of which seem to be top-notchers at holding their nuts over vile roads.

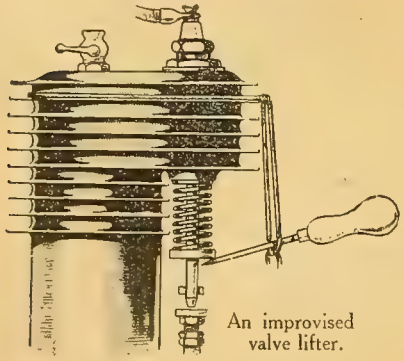


This photograph conveys a good idea of the engineering difficulties that road builders experience in mountainous countries. The scene depicts a Triumph in the French Alps, on the road to Paget Thenier from Nice, a district noted for its magnificent scenery.

IDEAS: Useful and Ingenious.

An Improvised Valve Lifter.

MORE barked knuckles result from attempts to remove valves without a proper tool for the purpose than, probably, from any other adjustment on the motor cycle. Yet there is an extremely simple method which only calls for a strong screwdriver or similar tool, and a length of string or, preferably, wire. The illustration shows how the loop is made to act as a fulcrum for the lever.—G.H.



An improvised valve lifter.

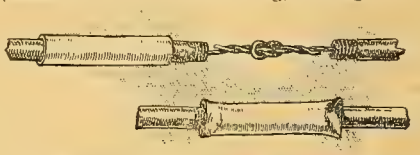
Spring Luggage Grid for Millford Sidecar.

THIS home-made grid has the advantage of being sprung without the necessity of disfiguring the sidecar body. The sides are of 1in. × ¼in. wrought iron, also one of the cross-pieces, which, as shown, has two ⅜in. clearance holes about 2in. from a bend at either end. The remaining cross-pieces are of ½in. round bar riveted in place, but the inside bar must not be fitted until everything is ready for attachment. The clamps, two of each pattern, are easily made by a blacksmith. Spiral springs on the projections of the rear clamps support the carrier, and are adjustable in tension by means of locknuts. The grid, of course, pivots on the forward clips, while for certain classes of work it may be found advantageous to prolong the spring carriers on the rear clamps and thus fit springs *above* the cross-piece as well as below. C.C.M.

An ingenious method of making a sprung luggage carrier for a Millford sidecar.

Repairing a Bowden Wire.

IN the event of a Bowden wire breaking, a temporary mend may be effected as illustrated. First, the position of the break is discovered, then the cover is cut at that place and the casing removed for about two inches. The wire is then joined by twisting, a piece of metal-tube (about half or one inch long) having first



A temporary method of mending a broken Bowden wire.

been slipped on to the wire as in the higher illustration. The tube is then slipped over the exposed wire and the two ends of it are hammered flat, so as to keep it in position. This method can, of course, only be adopted on certain occasions.—G.T.W.

Improving an Old F.N. Distributer.

PROBABLY one of the most irritating points on the older types of F.N. machines is the distributer. Oil and dirt here cause misfiring, which is most unpleasant at low speeds. Some riders have gone to the expense of a magneto with a self-contained distributer, but the old distributer, as fitted to the end of the camshaft, can be made entirely satisfactory if the following plan be followed.

Remove the carbon brush and check the diameter, then get a few inches of soft 18 S.W.G. wire, and coil this on a spoke or a nail to an outside diameter equal to the brush. Withdraw the former on which the wire is wound, and turn the sharp ends of the wire down the hollow centre out of harm's way. The overall length of the copper coil should be just enough to allow the distributer to be slipped over when the coil takes the place of the carbon brush. Having made the coil of the right dimensions, remove it, and slightly open the turns. If it is now replaced it will form a very weak spring, just strong enough to keep the two ends in good electrical contact. This brush will function under almost any conditions. —W.F.A.

Flywheel Brake on a Douglas

NUMBERS of W.D. Douglases are now on the road minus a front brake, and if their owners are to avoid police persecution this omission must be rectified. The simple flywheel brake illus-

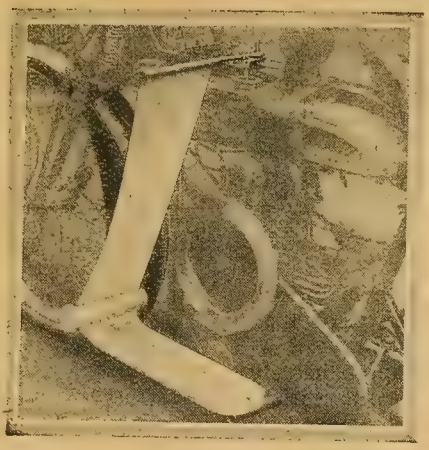
copper, is a remedy within easy reach any amateur who possesses a hammer a chisel or pair of snips.—T.G.W.

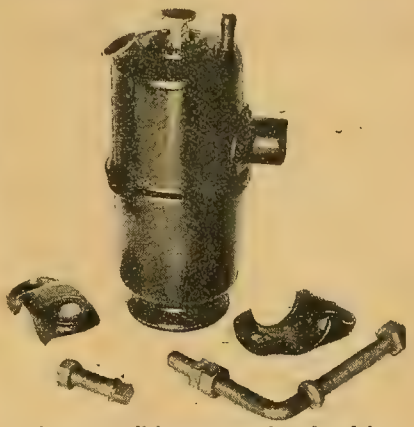
AMONG THE ACCESSORIES.

Some New and Practical Fittings Appealing to the Motor Cyclist.

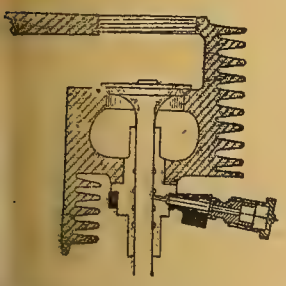
A new spring fork designed by A. Skinner, 15, Norcross Avenue, Tinsley. The illustration is self-explanatory.



A practical mudshield designed by Mr. H. B. Oxley, Messrs. F. Oxley and Co., 82, Caledonian Road, London, N.1. Each footboard consists of an aluminium casting, at the forward end of which is a cylindrical chamber enclosing a spring-controlled roller blind. When out of use the shield rolls away in the cylindrical casing, and is thus unobstructively stored.

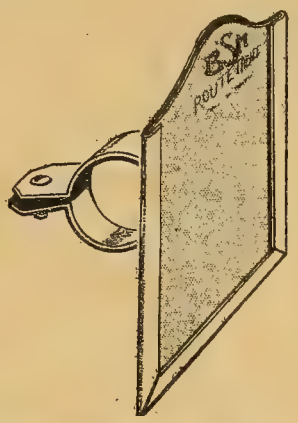


A neat rear light generator introduced by D. F. Lintine and Co., 86, Church Street, Shoreditch, E.1.

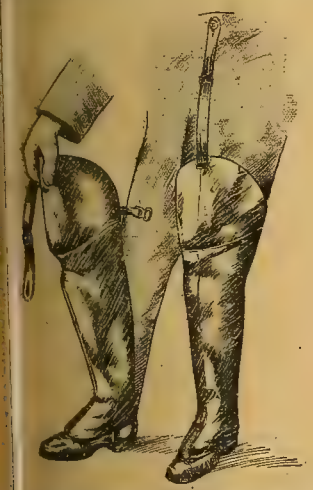


The A. and S valve stem lubricator ...rketed by the A. and S. Lubricating ..., 16, Rosebery St., Monk Wearmouth, ...nderland.

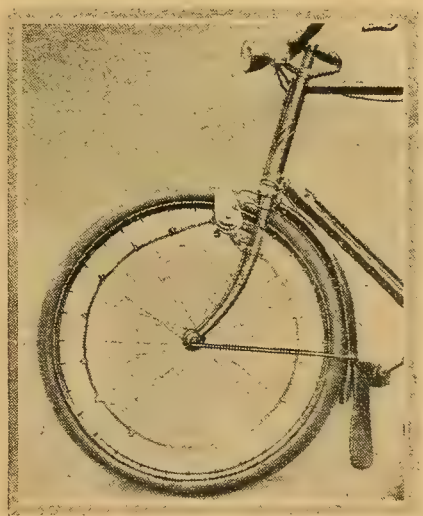
An adjustable belt fastener, the idea of Dr. F. McLaren, The Leuchold, Dalmeny House, Edinburgh. This adjuster will be on the market very shortly



The above handy route-card holder, consisting of a plated body and clip and a protective celluloid front, has been placed on the market by Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, London, W.C.1.



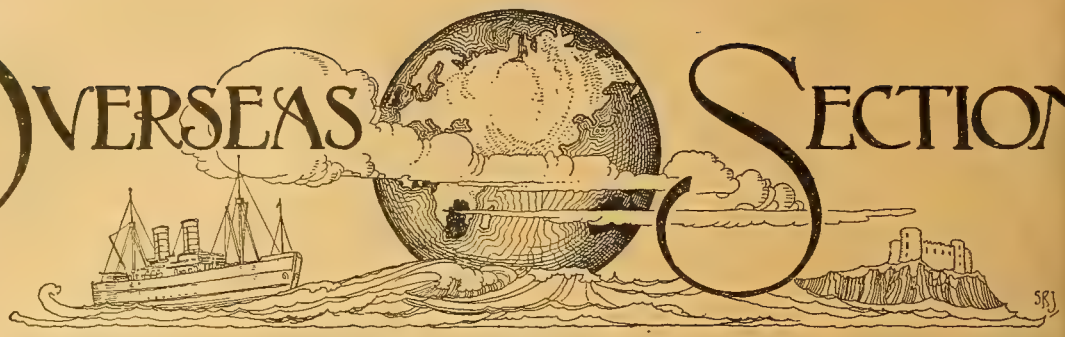
...ost motor cyclists who use their ...lines for all the year round business ...oses find the need for quick attachable ...detachable leggings. The Brooks patent ...g leggings meet this need, and are sold ...e form illustrated. They are made of ... waterproof canvas, for 45s. 6d.



A unique method of transmission for small dynamos. Attached to the spokes are a number of hooks which carry the small round driving belt. As the wheel revolves the belt is lifted from the hooks at that point where it passes over the dynamo pulley. J. Earnshaw, of 21, Harrington Street, Gorton, Manchester, is the patentee.

The Ace petrol filler, sold by Messrs. Gardner and Robertson, 576, Argyle Street, Glasgow, is an accessory which should be of great value to motor cyclists, as it enables a tank to be filled without waste. It can be stowed in the can itself when not in use, as it screws into the filler cap thereof, so that it is always available.

OVERSEAS SECTION



A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Exports Up. DURING September the value of British motor cycles exported was more than four times the corresponding figure in 1919. Allowing for enhanced values, this still means approximately three times the number of machines. Such a gratifying increase is good medicine for those pessimists who constantly decry British designs and British methods in the matter of overseas requirements. Incidentally it substantiates our claims of last month that 1920 machines are suited for any conditions where the horse or the Alpine-stock are not, obviously, the better aid to travel.

♔ ♔ ♔

The Question of Service. ON the other hand, why is it that British manufacturers cannot dispense with the present seasonal slackness and busy themselves in meeting the *summer* demands of the Southern hemisphere? The answer is partly lack of sufficient demand, caused by insufficient facilities for regular service. Only the paramount importance of the question forces us to hark back to this subject—important both to this country, where increased trade would lessen industrial tension by giving full-time employment to thousands and abroad where British products are much preferred

♔ ♔ ♔

Is there a Remedy? IF, in view of the tightness of money manufacturers cannot individually afford to establish depots in far-lying corners of the globe, why should not half-a-dozen leading firms combine their efforts and form an association for setting up and running *joint* overseas service depots? Such a scheme should embody efficiency with economy. The actual selling of new machines might well be left to existing agencies. A rapid and sustained increase in sales should quickly follow the knowledge that spares and repairing facilities were in reasonable reach.

ROUND ABOUT CAPETOWN.

These scenes are very reminiscent of our own country, and the roads, too, bear comparison with many of our own.

Entirely Advantageous to the Buyer. THE buyer, on the other hand, need not fear that such an organisation would tend to become a "trust" in its worst meaning. American competition alone should effectively prevent this, and it is more than possible that if one batch of British firms made a success of such a scheme, the remainder would not be long in following suit. Such depots would require in each case the services of a really competent engineer to take complete charge, and as the expenses would be shared by the various firms it should

Overseas Section.—

not be necessary to stint the effort by a failure to offer a salary which would attract the really efficient men. After all it seems like ignoring a special opportunity not fully to develop a demand that reaches its zenith yearly just when things are slackest in the home country. It has been proved time and again that British motor cycles will do the work required of them under any circumstances, and of recent times special attention has been paid to overseas requirements. It remains, therefore, to perfect the organisation and distribution of spares in order to satisfy riders in out-of-the-way parts and materially to increase our export trade.

A Selection of Letters from Readers scattered all over the World.

Some Australian Experiences.

An Australian correspondent gives an interesting account of his early machines, and a few words on present-day requirements :

"My experiences extend over a number of years. First, I had an old Griffon with accumulator ignition. This 'bus developed a cracked cylinder, and was enough to drive the most enthusiastic away from the pastime. Next a 5 h.p. twin Peugeot—a fine machine that gave place to a 4¼ h.p. Fafnir-engined Colonial-built mount. This, on the whole, proved satisfactory, but the flywheels seemed on the small side, and consequently could not pull as slowly as was sometimes necessary in hilly country. So I sold it, and got an overhead 85 × 65 mm. twin Matchless-Jap, and it was some bicycle. You could push the Cowey speedometer round to zero again any time, and it would climb anything. It was geared about 2¾ to 1, and pulled magnificently. I remember it was geared high, with the idea of keeping the revolutions down, and thus saving the valves. (I have never yet broken a valve on any machine.) It was followed by a 4 h.p. J.A.P., another good machine; and in 1915 I got a Douglas, my first with gears. It was used near the Murray, where I had to do a daily journey of about twenty-four miles. This machine averaged 120-140 miles per week for 'work' and as much again for pleasure, often double banked, and was most consistent, only a spoke and front fork spring going once in a while. After a fair amount of work I went to a very mountainous district, parting, for the time being, with motor cycles, but still retaining a love for them.

"Being married, and wanting another machine, I thought it best to invest in a sidecar outfit, so purchased an 8 h.p. three-speed Harley-Davidson and sidecar. The machine itself was good, but the sidecar would not stand up to its work, the connections often breaking, considerably frightening the occupants. So it all had to go. This was in November, 1918. I have got the motor fever again, must have another machine, and now for my story.

"I am an Australian, and want to have, all things being equal, or up to a fair thing in favour of a British mount, a machine produced within our Empire, which, of course, boils down to England. But what do we find? The Americans have practically captured these markets during the war, and are not, after getting a decent business together, going to drop them if they can help it. The English manufacturers should open branches in Melbourne and Sydney for their products, and sell at competitive prices. *One must not forget that there seems to be an idea getting around out here, and probably in the other Dominions, that the Yankees are turning out stuff that lasts, whereas, owing to the greater war stresses, the British article has not improved at the same rate.* At the time of writing, about eight months after the war, it is almost impossible to get a British high-powered motor cycle with a decent three-speed. Such machines are advertised in your paper, but, so far, that's our share of them."

Motor Cycles in Nyassaland.

A reader from this part of the world writes : "There are quite a few motor bicycles in the country, and of all makes. I have seen Triumphs, senior and baby, Scott, B.S.A., Douglas, Omega, P. and M., Matchless, Enfield, F.N., Humber, Clyno, Forward, Edmund, Indian, Henderson, Excelsior, Harley, Rudge, Rex, J.A.P., Peugeot, and last and about the least, the N.S.U.

"The roads are good for about forty miles, and run from Blantyre to Zomba, and are suitable for lorries. The rest are nearly good enough for motor cycles; in places they are mere native tracks with hectic bridges, and are as a rule quite good in the dry season, but in the rains I have had to run alongside a P. and M. in low gear on dead level to get it through the sticky mud. Where the mud is merely oily and greasy most surprising skids may be accomplished without any trouble whatever. The old P. and M. is a fine machine out here. It is ten years old, but it will take twelve stone over most of the hills in top. In fact, I put a high gear sprocket on the countershaft in place of the large low gear sprocket, thus giving a bottom gear of about 6½ to 1, which I find ample for any road in the district. It is not exactly a sound mechanical job, but it has worked perfectly for about 1,000 miles, and is vastly preferable to the absurd low gear of 9 to 1, as fitted by the makers.

"Personally, I am all in favour of the type of machine as ridden by one of your contributors, 600 c.c. single, low compression, variable jet carburetter, and single gear. Such a machine soundly constructed, and, perhaps, with a Phillipson pulley or engine shaft gear (no countershaft), should be ideal for this country. I am rather in favour of some sort of clutch and gear, as in places it is necessary to go dead slow, and also have plenty of power in hand, owing to atrocious surface, stone and mud, etc., too often terminated by a steep rise."

Pioneer Motor Cycling in India.

The Rev. G. W. Park, of Bombay, writes an appreciative letter containing interesting reminiscences of early motor cycling days abroad :

"I have been a reader of your paper since its first number, and have often had the idea of dropping you a note to say how much I appreciate it all these years. I think I rode one of the first motor bicycles in Bombay. This was an American Mitchell, a two-baby-power machine, which consulted its own pleasure in regard to running. I indulged in two other Americans before I decided that there would be no more Stars and Stripes machines for me. They had the old sky-scraper kind of frame, and needed adjustments every five minutes and every fifty yards. Thereafter I had a succession of English bicycles, winding up in 1914 with a 1913 single-geared Triumph. This was the best of the lot, but was not powerful enough to pull my sidecar against a heavy wind.

"On returning from furlough, I brought with me a 1915 big twin Indian with spring frame. This has proved itself the best of all my machines. I have ridden it 10,000 miles over all kinds of roads, mostly in Bombay. Three nuts have dropped off owing to my carelessness. No parts have had to be renewed except two parts of the front fork. I have never been stopped except for punctures, and the twist grip control is all one could wish. I have no interest in this machine except as a satisfied rider. Ten thousand miles is nothing to a modern first-class bicycle, and so no appreciable wear can be detected on mine.

"This is a great city. Our roads would make the angels weep. They are the product of home rule, which means repairs in the dim future, if ever. Pot-holes in the main streets in which one could hide. Pavements cluttered up with all sorts of rubbish, so that pedestrians take the middle of the streets. An endless procession of motors, horse vehicles, and bullock carts. No rule of the road which is observed by anybody. Policemen on point duty, whose signals would puzzle a Philadelphia lawyer. I find that the only way to cross the main streets safely is to ignore the policeman on point duty, and use my own judgment, and then go ahead. Otherwise I should have to stop to figure out what his signals meant. We have a speed limit of 20 m.p.h. in the city, but this is ignored until a bullock cart turns to the right square across your front. We are loaded down with taxation, and pay 5s. per gallon for petrol in order that the vendors may pay dividends of 30%."

The Motor Cycle in Czecho-Slovakia.

Activity in the New Republic. British Design becoming Standard on the Continent. New Motor Cycles and Seat Type Scooters.

(By Our Special Correspondent.)

IN view of the importance now attached to the export side of the motor cycle industry, it is interesting to know that British motor cycle design now sets the vogue in many countries where hitherto the motor cycle has not been at all popular.

Due to faulty development, poor engine design, etc., local makes were not much sought after, while the more advanced British types were speedily bought up by the public, who had a keen eye for the practical side of the pastime, and refused to ride the hopelessly top-heavy mounts supplied by many Continental makers.

British Influence.

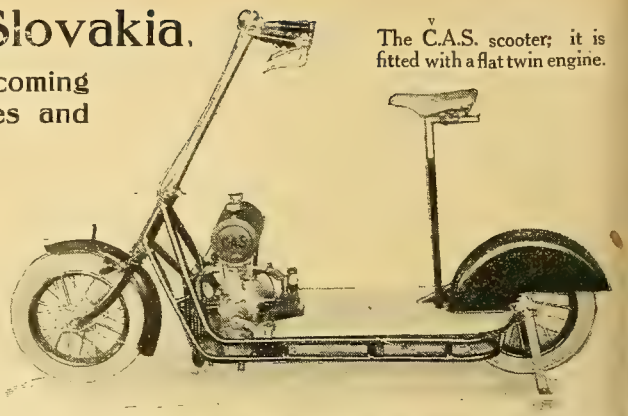
At present, the latest models of the Continental makers have a strong British flavour, as is illustrated in the leading Czecho-Slovak make, the Č.A.S.

The motor scooter, too, is popular here, which fact in itself speaks volumes for this new style of vehicle. For in such a hilly country the standard of efficiency for machines to be of any practical use must needs be a high one.

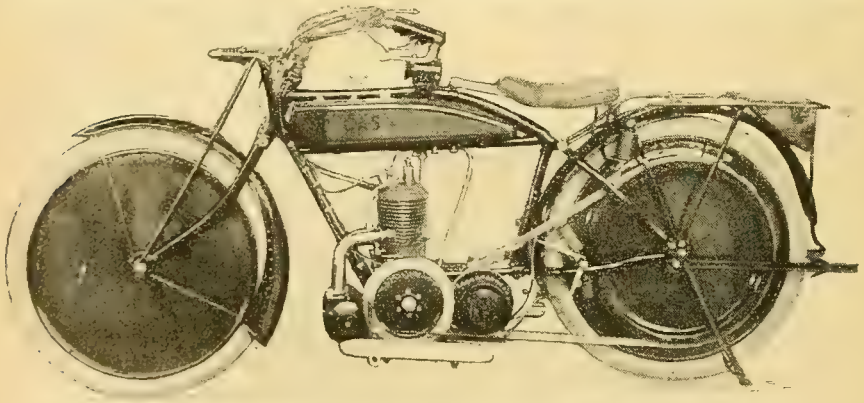
Both machines mentioned were exhibited at the recent Prague Show, where they met with much favourable comment, many orders being booked by the Č.A.S. Co.

While writing of Continental makes, it may be noted that the leading German manufacturers have abandoned most of their antiquated designs for machines built more on British lines. An example is the new type of Wanderer, one of which, ridden by L. Hunse, made a non-stop in the Dutch Trials; while others, like the N.S.U., seem to conform more to American ideas, minus, however, the twist grip control, which since the very early pioneer days has not been favoured in Central Europe.

Incidentally, as in many other of the new allied countries on the Continent, there is a ready market for British machines in Czecho-Slovakia.



The Č.A.S. scooter; it is fitted with a flat twin engine.



Novel saddle suspension and two belt rim brakes working on a common pivot are distinctive points of the Č.A.S. lightweight; otherwise it closely follows British lines.

Renewed Racing Activities in Central Europe.

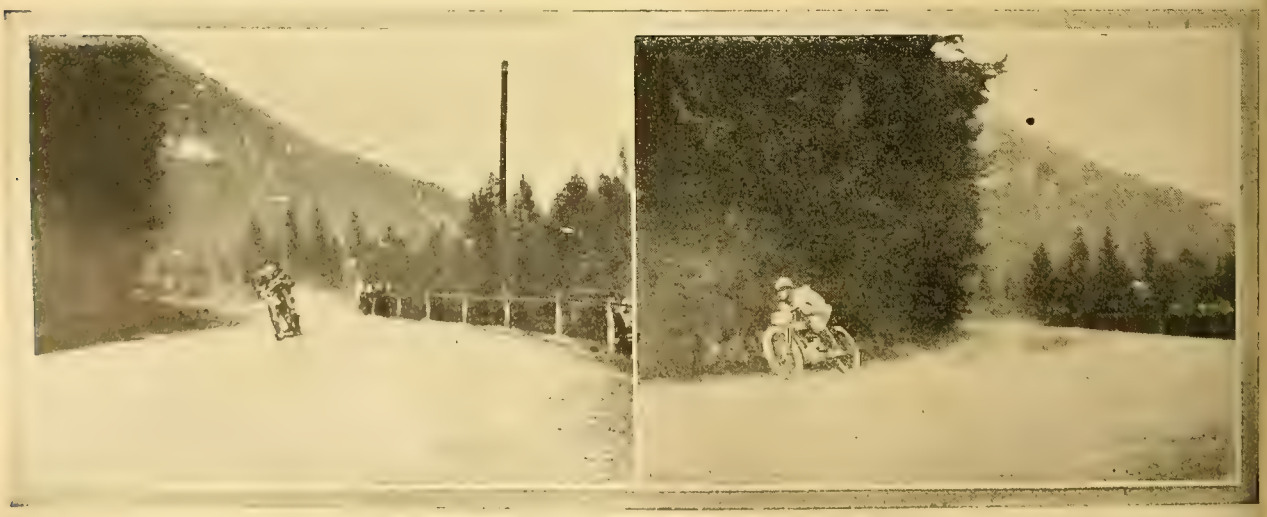
In spite of the general distress in Central Europe, motor cyclists there seem very keen on racing. The Semmering hill-climb (the Austrian classic event) was run off recently—the first since 1913.

All the events were won by imported machines of pre-war standard types, which, however, made fast times up the pass, which has a gradient of 1 in 4 on the worst bends.

One of the riders was Rainer Hapsburg, an ex-prince of the deposed Imperial house, who showed himself an expert in corner work.

The winners in the respective classes were :

Class 1, Krathy (S.I.A.M.T.). Class 2, Kaeslner (N.S.U.). Class 3, 1 Reikh (Triumph), 2 Braudtner (Triumph), 3 Rainer Hapsburg (Triumph). Class 4, Otto (Motosacoche). Class 5, Hartman (Henderson). Class 6, Brosh (Reading Standard sc.).



THE SEMMERING HILL-CLIMB. (Left) Rainer Hapsburg (Triumph), a former Archduke of the ex-Imperial house of Austria, on one of the bends. (Right) Hartman (Henderson), who made fastest time.

A VENTURI TYPE SILENCER

A NOVEL type of silencer in which the venturi tube principle has been successfully employed will shortly be placed on the market by Messrs. Keith Thompson and Co., 2, The Broadway, Wimbledon.

As may be seen from the illustration, the circular box contains a series of

The venturi silencer. The arrows indicate the direction of the exhaust gases.

double cones, which permit the gas to pass through the restricted holes in their centre or through slots cut on the outer circumference. It is claimed that the maximum amount of silence is obtained, with a minimum back pressure. This is achieved by using a series of venturi tubes and by releasing a proportion of the gases at the point of maximum pressure and lowest velocity it allows them to expand fully and cool in the outer chambers.

We witnessed a demonstration of this silencer fitted to a 4 h.p. Triumph motor bicycle and sidecar, and it was obvious that a considerable reduction in noise was effected. In fact, it was impossible to hear the noise of the exhaust above the tappet noise of the engine. The rear end of the box remained sufficiently cool to enable it to be held by the hand.

Further bench tests are to be made when interesting data regarding the amount of back pressure set up and the loss of horse power will be forthcoming.

This silencer is manufactured by Messrs. Parnaby and Coope, 7, South Parade, Leeds.

DRY BATTERY LIGHTING.

IT is always gratifying when a large and important firm turns its attention to the manufacture of accessories appertaining to motor cycles, and it is with pleasure that we are able to announce that Messrs. Siemens Brothers

The Siemens sidecar lighting set.

and Co., Ltd., Caxton House, Westminster, London, S.W.1, have recently introduced dry battery lighting sets for both sidecar outfits and motor bicycles. The company does not believe in the lighting of head lamps by dry batteries, but it is, rightly, of the opinion that for the side lamp and tail lamp this method is practically ideal. Needless to say the manufacture of the articles in question is beyond reproach. The bulbs are of the ordinary flash lamp type which can be obtained from any accessory dealer.

The dry batteries have excellent keeping properties. The best results, however, are obtained when on each occasion the lamps are in use the lighting period does not exceed two hours.

We were informed on the occasion of our visit to Messrs. Siemens that a No. 717 battery recently connected to a sidecar lamp, lighted for two hours per day for six days a week, gave fifty hours' light; so the rear lamp may consequently be expected to give the same result.

The batteries are contained in a neat black leather case provided with a metal frame designed to fit to some wooden portion of the sidecar. The lamps themselves are made from heavy drawn brass with machine-cut threads, and each is provided with a neatly designed self-contained turn switch. Each lamp is provided with five feet of waterproof twin flexible wire.

A similar set is supplied for use as a rear light, illuminating the number plate for solo machines, and also a rear lamp without a means of lighting the number plate.

A MOTOR CYCLIST'S TOOL KIT.

THE firm of Messrs. Alfred Herbert, Ltd., Coventry, whose machine tools are world-famous, is now turning its attention to the needs of motor cyclists. The illustration depicts the toolkit, which contains a nickel-plated oilcan, a pair of 6in. pliers, a 6in. half-round file without its tang, a belt punch, a 4×$\frac{3}{8}$in. knurled punch, a 6in. adjustable spanner, a good screwdriver, two one-minute tyre levers, and three tubular spanners to fit $\frac{9}{16}$in., $\frac{1}{4}$in., $\frac{5}{16}$in., and $\frac{3}{8}$in. nuts, and a $\frac{9}{32}$in. square nut.

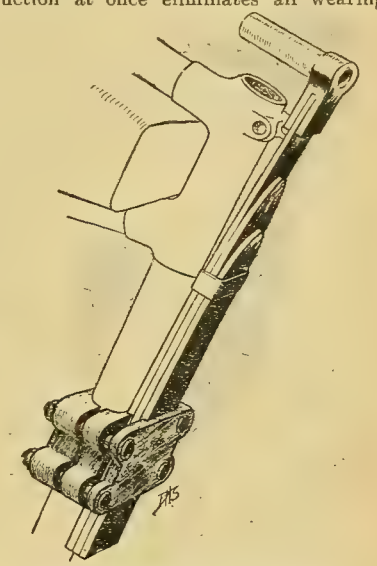
The tools are carried in a good quality canvas roll, fitted with steel frictionless spacing loops. It is strongly bound at the edges and provided with a pocket for carrying the oilcan.

A motor cyclists' tool-kit by a world-famous house of tool specialists—Alfred Herbert, Ltd

A SATISFACTORY SPRINGING ARRANGEMENT.

AT the present moment, no doubt due to the combination of existing road surfaces and our lack of spring frames, a number of devices to ensure the comfort of the rider are being produced.

Prominent among these are a variety of spring seat-pillars, which more or less insulate the rider from the rigid portion of his machine. Of late we have been testing one of these, which is known as the Flexa spring seat-pillar. It is of extremely simple construction, since it consists merely of a pack of leaf springs (with a suitable attachment at the extremity on which the ordinary saddle clip is fixed) and a clamp by which it is secured to the saddle tube of the ordinary motor cycle frame. This construction at once eliminates all wearing



The Flexa seat-pillar, which consists of a laminated spring.

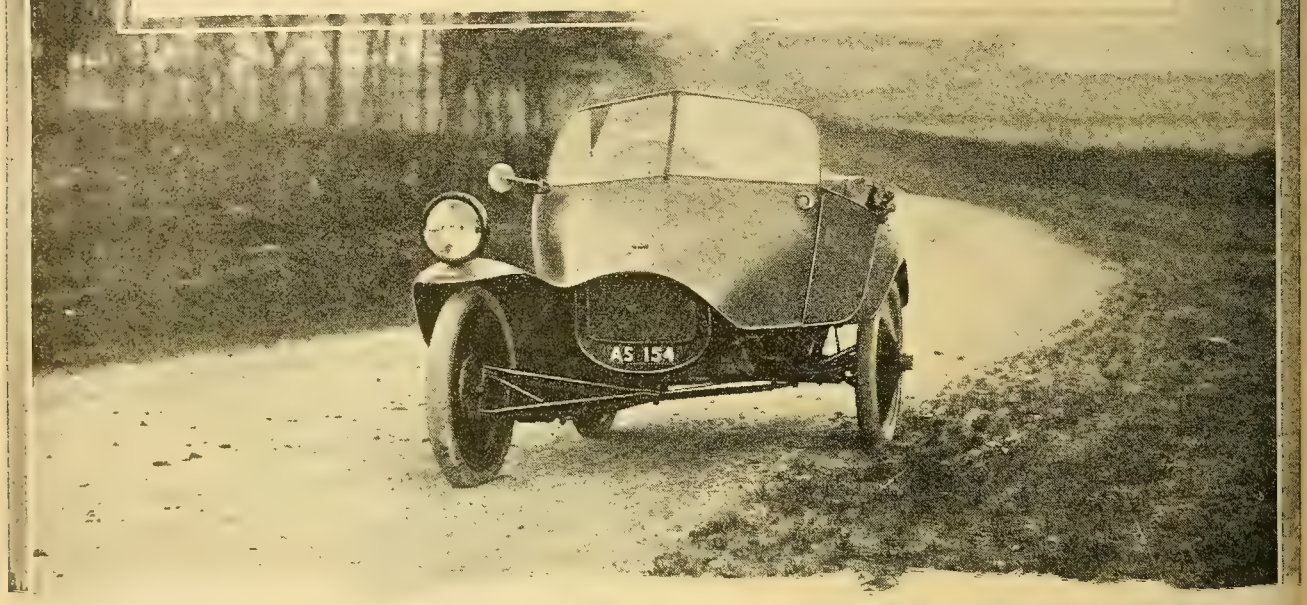
joints, and provides a never-failing assurance against lateral movement, which is the chief objection of most springing systems, whether auxiliary or a part of the original design.

Adjustment for Varying Weights.

By sliding the spring clamp higher or lower, the resilience of the spring may be checked or increased, so making the device adjustable for varying weights. No attention is required once the fitment is installed, except an occasional spot of thin oil inserted between the leaves of the springs.

Of the comfort afforded we can speak very highly, since, in conjunction with a good saddle, it appears to make a spring frame quite unnecessary—at any rate, as far as the rider's comfort is concerned. The price, moreover, is extremely reasonable. The maker is Mr. E. H. Derricott, 72, Lozells Road, Birmingham.

A DEVELOPMENT OF THE SIDECAR.



After Five Years of Testing, the Scott Sociable will be on View at Olympia. First Description of the Final Production Model.

TWO or three machines stand out in the history of the motor cycle movement, since they bear that stamp of true inventiveness which marks the work of the creative engineer.

It is significant that two such productions have been fathered by the same brilliant designer.

The Scott Sociable has had, in all probability, a more interesting and painstaking development than any other production which has been placed before the motor cycle public.

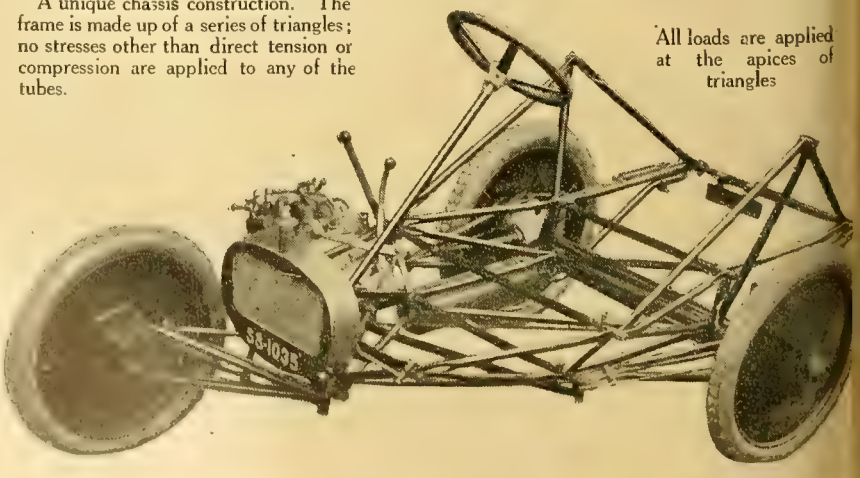
In the early days of the war the authorities who used the Scott machine gun sidecars demanded greater power and range of gearing. The designer realised that to do this would need much alteration of existing models, and, consequently, decided to lay down a chassis for the specific purpose of gun-carrying. All the qualities of the motor cycle and sidecar were to be retained, since, as a vehicle, the sidecar is not to be excelled in its lightness of weight, possibilities of load carrying, [illegible] handiness, and remarkable [illegible] to the extreme steering [illegible] three-foot two-track layout [illegible] feature of design [illegible] triangulated [illegible] the chassis of [illegible] to which the [illegible] is subjected when negotiating uneven ground.

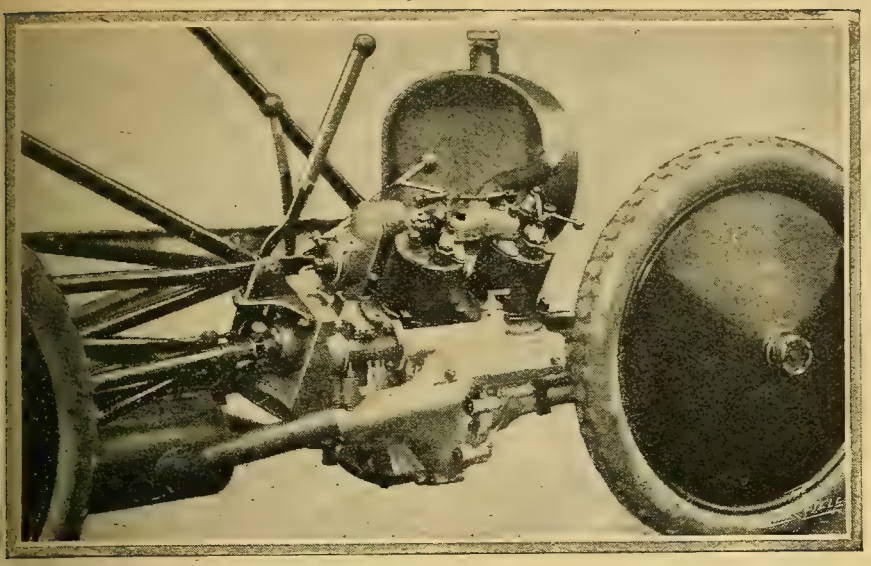
Chassis Assembly.

The chassis consists of a tubular framework of triangular plan, truncated towards the front. Struts cross this frame in all directions, along which stresses exist, so that the whole structure becomes a series of triangles with apices wherever a load is applied. By this method of construction, the tubes are freed from torsional or bending stresses, and every frame member is in direct tension or compression.

A word is necessary as to the method of building. No brazing is employed in the chassis, since all the tubes are of standard lengths, formed with suitable eyes at the ends, through which bolts pass; the bolts also are alike in every case. Three standard tube lengths are used, and two lengths of standard eye-bolt, consequently one spanner is the only tool necessary in the assembly of the chassis from the component parts.

A unique chassis construction. The frame is made up of a series of triangles; no stresses other than direct tension or compression are applied to any of the tubes.





The Scott Sociable two-stroke engine (578 c.c.); a complete unit, with gears and clutch attached to the chassis with four bolts.

The suspension is by means of coil tension springs, used in pairs, and ten exactly similar springs are used in all.

At the front the wheel is carried on a "fork" swinging on trunnions upon a transverse member of the chassis. The fork is also built of standard tube lengths, and all its triangles converge at the steering head and stub axle which it carries. A rack and pinion steering gear is fitted.

A similar method is used in building up the back axle, which consists of four tubes. These are bolted at each end to aluminium castings, which serve to carry the brakework and the stub axles, upon which the ball-bearing hubs of the detachable wheels are mounted. (Only the off side wheel is driven, but an independent brake is fitted to each side.)

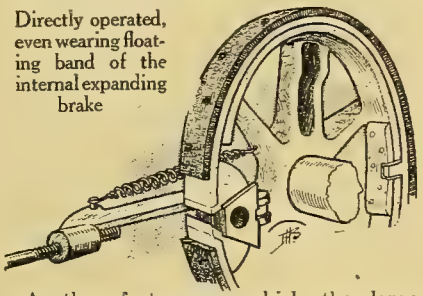
A system of links and coil springs insulate the chassis from the rear axle, which is located by radius rods at each side. There is also a transverse distance rod from the near side of the chassis to the bevel gear casing of the off-side wheel in order to prevent lateral sway when cornering.

Unit Engine and Gear Construction.

The base casting of the 578 c.c., two-cylinder, two-stroke, rotary valve engine contains a flywheel clutch, hand starter, and three-speed constant-mesh gear box. The entire unit, together with the complete controlling gear, is removable from the chassis by loosening four nuts and the cover of the propeller-shaft universal joint. The engine has two cylnders (76.2×63.5 m.) with cranks set at 180° and central flywheel. Symmetrical cylinders are used, machined all over, and the water-jackets are steel pressings welded into position. Slting-down flanges are situated about half-way up the cylinder walls, so that a very long spigot projects into the crank case, and all the ports (both exhaust and transfer), as well as the lower water passages, are cast integrally with the cylinder. It will thus be seen that only one packing, common to all gas and water joints, is needed.

An unusual shape of gas deflector is used on the piston, which has three rings at the top and one at the skirt. A parallel gudgeon pin is fitted, secured by pins at each end; the latter are recessed in slots cut in the piston walls. The engine, except the small end, is equipped with double row roller bearings throughout.

Gas is supplied by a Zenith carburetter by way of a cast aluminium combined inlet and exhaust manifold, while rotary inlet valves are employed to increase the efficiency of the engine.



Directly operated, even wearing floating band of the internal expanding brake

Another feature on which the large power output depends is the double pole ignition, which has finally been made satisfactory by the use of the Scott double pole plug; this enables the M-L magneto to give two simultaneous sparks at the moment of firing. An M-L impulse starter is fitted to the magneto, and it is found that this greatly facilitates starting.

Transmission Details.

The clutch is carried inside the flywheel, and is of such a nature that once assembled inside the engine it cannot be reached. No adjustments are either provided or needed, as the action consists of a combination of the metal cone and expanding ring type, which is entirely self-adjusting as wear proceeds.

The drive from the clutch is by a double helical pinion to the gear box, mounted in an extension of the crank case casting. Very simple construction has been achieved in the change-speed mechanism, which consists of six wheels in constant mesh. The top gear is direct, and changes are effected by a cam mechanism, which is always locked until the clutch is released.

In the opposite end of the casting is carried a shaft which is concentric with the gear mainshaft. This shaft is used for the starting mechanism, and also is extended to drive the centrifugal water circulation pump.

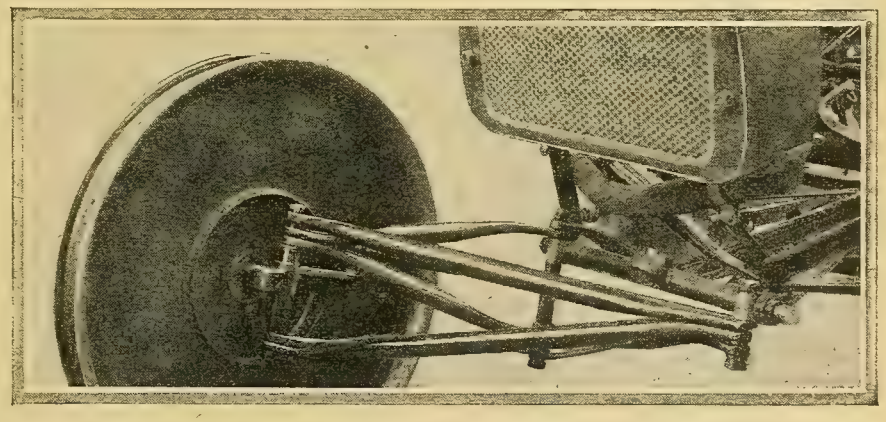
Provision is made for a lighting dynamo on the top of the gear casing.

The drive from the gearshaft to the bevel-driven back wheel is through a simple sliding and universal joint, mounted in a spherical housing at the front end of the propeller-shaft torque tube.

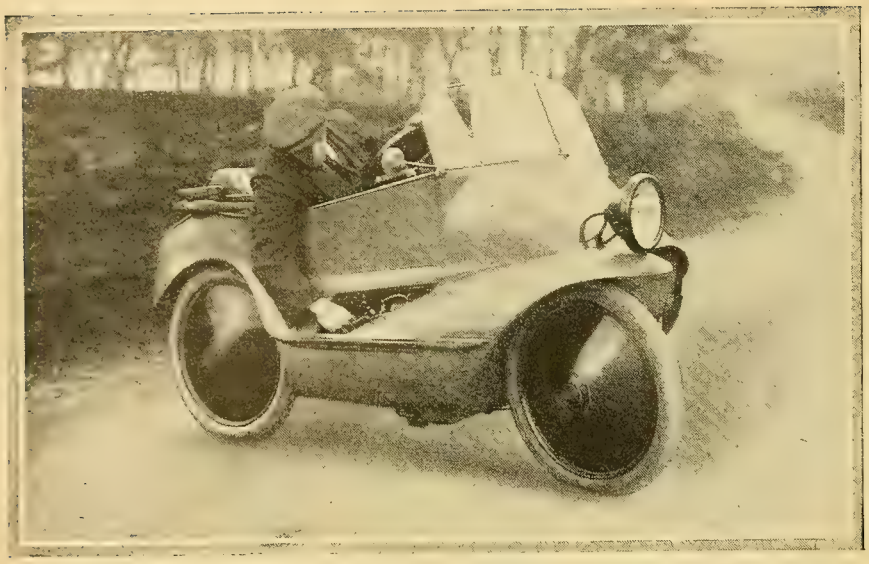
Bodywork.

Bodywork is quite as unconventional as the chassis. In motor car construction the coachbuilder necessarily uses a heavy framework of timber to resist the effect of torsion in the chassis; but as the Scott Sociable suffers little in this direction, and as the seats are directly mounted on the chassis, the body merely acts as an encircling shell (carrying only the hood and screen) for the purpose of protecting the passengers. It is noteworthy that number plates, lighting equipment, controls, and seats are all directly fixed to the chassis, and if the body be removed, the car still remains in a drivable state, complying with all requirements, mechanical and legal.

The seat and backrest are suspended from the apices of triangular chassis members, and are instantly detachable, while the body, being constructed of a fibrous material, is extremely light, does not suffer in minor collisions, and is



Front wheel bracket; it is a structure which can only collapse or distort by the absolute fracture of one of its tubular members.



On the road the Sociable is remarkable for its accessibility. The "engine house," with its "roll-top" cover opened. The driver turns on the petrol and floods the carburetter preparatory to using the internal starting lever.

easily cleaned. A sliding cover somewhat like a roll-top desk completely encloses the engine, which is carried outside the chassis on the off-side; the cylinders have a slightly outward slope, and are perfectly accessible from the driver's seat.

Over the front wheel the petrol tank is carried, so that it serves the additional purpose of a wing for the front wheel; otherwise there are no mudguards, for the body itself overhangs the rear wheels. A specially commendable feature is the fact that there are no excrescences on the body with the one exception of the radiator cap; cleaning is therefore a matter of a few minutes' work with hose and sponge. The wheels are also conducive to cleanliness, since they are constructed of sheet steel pressings.

Protection and Comfort.

In order to protect the occupants a V shaped screen is fitted, and this has an observation slit which permits the driver to obtain a clear view of the road, even when the screen is obscured with mist or snow. The angle of the screen is such that air is deflected past the slit and beyond the sides of the car; even when the hood is raised there are no back draughts inside the body.

During a shower it is the work of a moment to raise the hood, which can be secured and released without stopping, if the driver so desires.

At each side of the seats are capacious lockers, while there is a convenient shelf for oddments such as gloves, pipes, and [illegible] in the dash.

The spare wheel is carried beneath the [illegible] kept free from mud [illegible] handle when required. [illegible] is a large flat [illegible] capacious hood [illegible] or any [illegible] be stowed; or if an extra passenger has to be accommodated, the lid of the boot may be instantly erected as the back rest of a dickey seat.

Wheels and Brakework.

Although the drive is to one wheel only, there is a brake on each near wheel; the foot-brake acts on the side wheel while the hand-brake works on the driver.

Internal expanding bands are used, and these are operated by a direct pull of the control rods which draw wedges into the joints of the fabric faced spring steel rings. These rings are not divided and hinged, but are merely prevented from rotating by a loosely fitting stop. In consequence the ring expands equally, and wear on the braking surfaces is distributed over the entire circumference of the shoe; the detachable wheel hub-shells are formed with an enlarged portion acting as the brake drum. Incidentally, the wheels themselves are most simple in construction, consisting of two stamped discs assembled over the hub-shell and electrically welded in position, after which the tyre rim is welded to the outside edge. Under test a dead weight axle load of six tons was found necessary entirely to collapse one of these wheels.

A ROAD TEST DESCRIBED.

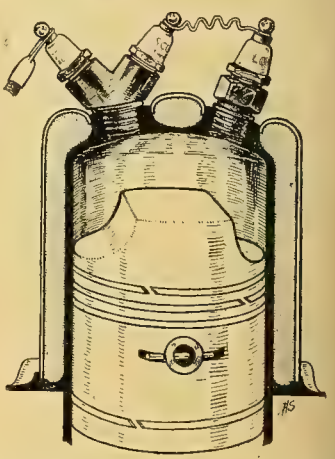
After having carefully examined a number of machines in the course of erection, and also observed the accurate production of parts in the Scott Autocar Company's Works at Lidget Green, Bradford, we were handed over to the care of Mr. Frank Philipp, well known as a rider in pre-war motor cycledom, who is now demonstrating the possibilities of Mr. A. A. Scott's latest creation.

Before leaving the works several of the features which will appeal to the owner-driver were demonstrated. For instance, in order to examine the action of the brakes, it was shown that the wheels could be detached (with the use of a tyre lever) in a matter of ten or fifteen seconds; the arrangement of the hub lock nut, however, is such, thanks to the positive locking device which operates at any position that it cannot come off the hub unless it is released by hand, even though it be only engaged upon one or two threads.

The light weight of the Sociable was shown by lifting both back wheels off the ground, while the side wheel may be lifted to almost any height, thus giving easy access to the underneath parts for cleaning purposes; incidentally the effectiveness of the springing was also made clear, since after lifting up the wheels to a height of at least 3ft. the machine was dropped suddenly, and the resilience of the suspension simply allowed the machine to rise and fall at a gradually diminishing rate until it finally came to rest.

An Inside Starting Lever.

Everything now being ready for our trip upon the road we took our seats, and the driver, leaning over the side, opened the "roll top" cover above the engine. Having primed the engine, the cover was closed down again and a pull given to the starting lever beside the driver's seat; the engine at once responded, and after freeing the gear lever by withdrawing the clutch, low gear was engaged and the car started away up a steep and rough gradient. (Mr. Scott appears to have a penchant for situating his works at the foot of freak hills of the A.C.U. type!)



Unusual design of the piston; showing also a section of the cylinder and Scott patent double-pole sparking plug.

Once out of the congested traffic of Bradford, we took over the steering wheel and found that the driving of the Sociable was delightfully easy—in fact, after the usual motor cycle or light car control, it was found a little difficult at first to accommodate ourselves to the delicacy of all the operations. For instance, the steering is managed with one finger on the wheel, while the three-speed constant mesh gear box, being spring operated, causes the lever to go almost of its own accord into the various notches of the quadrant.

Power and Speed.

There was no suggestion of the machine being under-powered, since all ordinary running, even up quite considerable hills, was done on top gear, while congested traffic scarcely ever calls for a

A Development of the Sidecar.—

gear change, thanks to the remarkable acceleration which this 578 c.c. engine affords.

On the level the speed (by Bonniksen speedometer) is from 40 to 42 m.p.h., and this was reached in a surprisingly short distance; when hill-climbing, if the speed on top gear drops to about 18 m.p.h., it is advisable to change to second in order to keep up a higher average pace, since 25 to 28 m.p.h. can easily be attained up hill on second.

As the engine is lubricated by the petroil system, the driver has no worries regarding the continuity of oil supply. Oil consumption is about one pint per 200 miles, while the amount of fuel used is one gallon per fifty miles under average touring conditions.

Ease of Steering.

One of the most attractive features of the Sociable is its extraordinary mobility. No reverse is fitted, nor is it necessary, for it can be turned quite easily in its own length; for example, a signpost was over-shot in a narrow lane where an ordinary light car could not have been turned until a suitable opening was found for reversing. With the Sociable, however, it was no trouble simply to swing round in the road, using the side wheel as a pivot. So great is this power of turning in a confined space that the designer has fitted "rubbing strips" of hard wood around the engine casing, so that accidental impact with gate posts, or the corners of walls, may not cause any damage; this idea, of course, has been adapted from boat practice.

The springing is probably better than that of most motor cars, and full speed may be maintained over roads of any description. Even over the worst pot-holes the shocks felt by the occupants are only of a minor nature, and have nothing in common with the sickening jolts experienced with most light vehicles.

Curious Braking Effects.

Until one has become accustomed to the steering control, a curious sensation is experienced when applying the brakes. The foot brake has most general use, and this acts upon the side wheel. The hand brake works on the driving wheel. When decellerating on a straight road, we found that when the clutch is withdrawn and the foot brake applied, the tendency is for the car to run towards the left-hand side. If, however, one slows down by simply releasing the accelerator pedal or by applying the hand brake, the tendency is for the side wheel to over-run the driving wheel, and so swing the machine over to the right. After a little practice, these tendencies are automatically corrected by the steering wheel, and we were told that after more experience the driver is able to use braking to considerable advantage when taking corners.

Afterword.

Altogether, we were very much impressed by our experiences of the Scott Sociable, alike as regards its design, the methods employed in this production, and its performance on the road. It is perhaps but seldom that the journalist finds a machine which is so replete with innovations that he can thoroughly extend himself. The vehicle under review, however, has so many new features (even the door latches and the strap buttons on the hood have their points) that amidst such a mass of interesting details it becomes almost impossible to do more than hint at the possibilities of the design. All we cay say is that the Scott Sociable strikes a new note in machines of the motor cycle type; the claims made for it are very ambitious, and yet appear to be fulfilled entirely. To describe closely every one of its commendable features would require more than a complete issue of *The Motor Cycle*, and we can only advise our readers to make a point of inspecting this production at the forthcoming Olympia Motor Cycle Show. Those who are not able to do this will no doubt see it upon the road in numbers which will assuredly increase as time goes on.

Competitions in Many Lands.

Some Brief Reports of Trials and Races from our Overseas Mail Bag.

USTRALIA—

1,114½ Miles in 24 Hours.

NOW that motor cycles are capable of such high speeds, thousand-mile road records are only possible in untries less congested than Great itain. For that reason Australian, rican, and American motor cyclists ve a form of sport unknown to riders this country.

To cover over 1,114 miles on the road twenty-four hours is good going—it almost the average speed for the T.T. ch a run was made in August last at le by Harold Parsons on an Indian out. The previous record for this ie was 851 miles, established in South stralia.

UTH AMERICA—

Races at Santiago de Chili.

On Sunday, September 5th, a somewhat able road race of 215 kilometres took ce in the region of Santiago, between capital and Puente Alto, which was cribed as the Tourist Trophy Race. The 215 kilometres were run in five s of 43 kilometres each. An extrainary amount of excitement was evit owing to the presence of the four able Valparaiso riders — Maillard, lson, Thiele, and Moreno.

The winners were :

A. Friedmann (Indian); 2, G. Thiele (Harley-idson); 3, A. Follert (Indian); 4, C. Saez (Exor).

Other race winners were as follows :

A. Rodriguez (Cleveland); 2, J. Aberlaida mph); 3, R. Gonzalez (Cleveland).

DECARS.—1, M Sepulveda (Harley-Davidson). HALF-POWER" MACHINES.—1, G. Higueras ian).

SWITZERLAND—

The Flying Kilometre Speed Trials at Geneva.

The historic flying kilometre speed trials were recently run off by the Moto-Club de Pâquis. The record established by Lavanchy was not beaten, the best time being made by Pélissier (Motosacoche), namely, 42.1s. standing start, and 30.3s. flying start. Results :

SIDECAR CLASS.—500 c.c. Junior: 1, Plumettaz (Motosacoche), 46.8s.; 2, Schallier (Motosacoche), 45.8s. 750 c.c Expert: 1, Schorp (Motosacoche), 46s.

1,000 c.c.—Junior: 1, Rolland (New Imperial), 41.9s.; 2, Frilliard (Motosacoche); 3, Curtenaz (Motosacoche). Experts: 1, Gex (Motosacoche), 39.2s.; 2, Weber (Indian); 3, Laeser (Harley-Davidson).

250 c.c. CLASS.—Gubexan (Condor), 43.1s.

TOURING CLASS.—Junior: Meyer (Condor), 55.1s. Expert: Sordet (Skootamota), 83.8s.

350 c.c.—Junior. 1, Brot (Omega), 46.1s.; 2, Jean (Douglas); 3, Pythoud (New Imperial). Experts: 1, Nutzli (Douglas), 43.2s.; 2, Delmont (New Imperial); 3, Wuillemin (Condor).

500 c.c. CLASS.—Juniors: 1, Dunant (Motosacoche), 35.2s.; 2, Plumettaz (Motosacoche); 3, Pelligot (Motosacoche). Experts: 1, Demont (Norton), 35.8s.; 2, Guiguet (Motosacoche); 3, Sonvairan (Motosacoche).

750 c.c. CLASS.—Juniors: 1, Lenn (Indian), 36.3s 2, Staub (Indian); 3, Neri (Motosacoche). Experts: 1, Speide (Quick), 32.5s.; 2, Meylan (Moser); 3, Moebus (Indian).

1,000 c.c. CLASS.—Junior: Borsetti (Harley-Davidson), 35s. Experts: 1, Pélissier (Motosacoche), 30.3s.; 2, Jonneret (Indian), 32.1s.; 3, Bouvin (Motosacoche).

The following are the results of the kilometre standing start :

JUNIOR CLASS.—250 c.c.: Meyer (Condor), 1m. 10.4s. 350 c.c.: 1, Sevhaud (Moto-Rêve), 56.6s.; 2, Brot (Omega), 56.6s. 500 c.c.: 1, Dumant (Motosacoche), 49.6s.; 2, Dalavy (Condor), 53s. 750 c.c.: 1, Lenn (Indian), 47.8s.; 2, Staub (Triumph), 50.4s. 1,000 c.c.: Borsetti (Harley-Davidson), 46s.

EXPERT CLASS.—250 c.c.: Sordet (Skootamota), 1m. 18s. 350 c.c.: 1, Demont (New Imperial), 56s.; 2, Wuillemin (Condor), 56.8s. 500 c.c.: 1, Guiguet (Motosacoche), 46s.; 2, Fournier (Moto-Rêve), 46.6s. 750 c.c.: 1, Speidel (Quick), 44s.; 2, Moebus (Indian), 52.4s. 1,000 c.c.: 1, Pélissier (Motosacoche), 42.2s.; 2, Jonneret (Indian), 44.4s.

ITALY—

The Circuit of Brescia.

On the 10th inst. the Italian race meeting, known as the Circuit de Brescia, took place in extremely bad weather. A total of sixty competitors turned out, but owing to the continual rain, and the condition of the roads, almost 50% retired without completing the course.

The distance of each lap was approximately forty-three miles, and had to be covered by the 350 c.c. class four times, 500 c.c. five times, 1,000 c.c. five times, and by the 1,000 c.c. sidecar twice. The fastest time of the day was made by D. Maloisi (Harley-Davidson), who covered the course in 4h. 9m. 38⅕s. The following are the results :

350 c.c.—1, E. Musso (Della-Ferrera); 2, O. Garanzini (Verus); 3, R. Tassinari (Beardmore-Precision).

500 c.c.—1, G. Ricci (Triumph); 2, A. Marcoli (Triumph); 3, A. Poletti (Frera); 4, G. Zanchetta (Gilera); 5, E. Cauali (Triumph).

1,000 c.c.—1, D. Malvisi (Harley-Davidson); 2, P. Bordino (Harley-Davidson); 3, E. Visioli (New Imperial); 4, C. Contarini (Harley-Davidson); 5, Nuvolari (Harley-Davidson).

SIDECARS (1,000 c.c.).—1, C. Contratti (Harley-Davidson); 2, U. Manganotti (Excelsior); 3, F. Casati (Excelsior).

The Circuit of Rome.

Another Italian event was the Circuit de Rome. The results were as follows :

750 c.c. CLASS.—1, Garettoni (Harley-Davidson); 2, Loreti (B.S.A.); 3, Urgesi (B.S.A.).

500 c.c. CLASS.—1, Moretti (Frera); 2, Robbio (B.S.A.); 3, Viscana (Frera).

350 c.c. CLASS.—1, Petrucco (Douglas); 2, Urgesi (Douglas); 3, Valentini (Douglas).

PETROL CONSUMPTION TESTS.

Sir,—Having read in your most interesting paper a letter from a correspondent which stated that he had travelled for a distance of twenty-four miles on a pint of petrol, I have made two attempts at improving this on a 2¾ h.p. 1920 Wooler. The first attempt was at an average speed of about 27 m.p.h., on a main road, with normal barometer, and a temperature of 62° F. The amount tested was half a pint, on which the machine ran eleven miles. This gave twenty-two miles to the pint, which was not satisfactory. After adjustment and certain slight alterations, I made the following test: Speed, 25 m.p.h. (economical); barometer, 29.51"; thermometer, 61° F.; start 11.40 a.m., speedometer showed 1140.8; finish, 1 p.m., speedometer showed 1168.9—28.1 miles.

The pint measure and speedometer were both checked, the former by an impartial observer, the latter by milestone readings.

The road chosen was the Aylesbury-Uxbridge. A standard B. and B. carburetter (with Wooler pilot jet) was fitted. A little extra air was admitted by a priming cock on the induction pipe. Carburine motor spirit was used. This all works out at 225 m.p.g.

C. M. M. BELL.

SILENCE AND PRESENT-DAY TRIALS.

Sir,—As a constant reader of your paper, I am much interested in the different opinions on the subject of long exhausts.

It is an established fact that a lot of young swell-heads like to boast about their huge exhaust pipes, and to accelerate constantly with a maxim gun effect when passing through crowds.

After trying both kinds of exhausts on a very aged Douglas, I find that the engine keeps cooler, pulls better, and also that misfiring disappears when using a long pipe, but, at the same time, by the usual method of backward saw cuts, it can be silenced with the same effect as an expansion chamber.

CHARLES PACKER.

Sir,—There seems to be a lack of the "live and let live" feeling amongst your correspondents who are now raising an outcry against that part of the fraternity who have "open exhausts." I am afraid that I must confess to be one of the "spoilers of a good sport" (to quote a recent letter), because to me an open exhaust means *power*, and power means *speed*, and speed means *all*. If I care to sail close to the wind in this matter, whose fault is it but my own if I am fined?

I would willingly enter for all the trials which are held, except that I have some regard for my machine, and I am by no means a Rothschild. What sport is there in going in for a trial in which you risk getting your frame broken, your tyres slit to ribbons, and yourself covered with bruises? I [illegible] that I am voicing the complaints of many such [illegible] when I say that "bumpometers" and "audio-[illegible] are [illegible] the spoil of our trials. Granted that [illegible] the breed, but after all, very few of the people [illegible] in on to an end." Some people will call me [illegible] I have made a point of asking if "all is well" [illegible] the road sides, and I go slowly through [illegible] on the open road I give my 3½ T.T. [illegible] and "tread." When trials cater for me I will enter, but until they stop hampering me with their [illegible] and the [illegible] which only mislead the [illegible] of 1920 machines.

RUDGE RIDER.

EFFECT OF TYRES ON M.P.G.

Sir,—Your correspondent "H.A." in his attempt to be facetious has fallen into an error of which no pedal cyclist (especially one with racing experience) would be guilty. It is common knowledge that light tyres mean increased speed for the same exertion, and, conversely, less exertion for the same speed.

In terms of power, as less power means less fuel, then light tyres must mean less fuel. A practical difficulty arises in the fact that too light tyres mean diminished reliability. Therefore, when extreme economy in fuel is desired, the aim should be to use as light a tyre as will last the distance over which the fuel consumption is measured.

It should be noted that a woven fabric absorbs much more power than a cross-laid fabric.

In conclusion, I should advise "H.A." to take a short spin on an ordinary roadster pedal cycle, and then on a racing machine fitted with racing tyres. The result will surprise him.

J. COHEN.

MYSTERIOUS ACCIDENTS—A POSSIBLE SOLUTION.

Sir,—The correspondence on the subject of mysterious accidents while motor cycling is most interesting.

I knew a lad who, before enlisting, was a van boy, and used to ride on the tail of the van and frequently "fall asleep" and drop off on to the road. In the Service, he would fall asleep while on sentry duty, and be punished for it. He always maintained that he couldn't help it. Finally he was sent to hospital where the Neurologist discovered that he was an auto-hypnotic subject, *i.e.*, he would hypnotise himself without knowing it and without being able to help it. He underwent certain treatment and is now cured. It seems not entirely impossible for this to be the explanation of these mysterious accidents. Hypnotic sleep is induced by looking at some bright object, *e.g.*, the top of a lamp or the ring of a speedometer. Clearly these accidents are not caused by a bump in the road or some mechanical defect in the motor cycle. It is significant that the subjects of them do not appear to sustain any serious injury. Sleep-walkers seldom do.

T. W. L. CASPERSZ, Chaplain, R.N.

SANS MAGNETO.

Sir,—With reference to the discussion in your columns relating to the engine running without a magneto, the possibility of the engine working on the Diesel principle need not be considered.

In the Diesel, as your correspondent, Mr. B. Hoddinott, points out, the compression reaches upwards of 500 lb. per square inch, but the gas thus compressed is pure air plus gas due to incomplete scavenging. At the top of the compression stroke the fuel is forced in at about 1,000 lb. pressure, and the high temperature due to this great and rapid compression of the air causes spontaneous combustion.

Now, in the Diesel there is no explosion in the sense of that occurring in the petrol engine, but a burning of the gases for about a quarter of the firing stroke, after which the gas expands adiabatically, *i.e.*, without further gain or loss of heat. The maximum pressure after burning commences is not greater than that due to compression, but actually falls. As the average person knows, in the petrol engine the burning is so rapid as to give a large increase in pressure practically instantaneously.

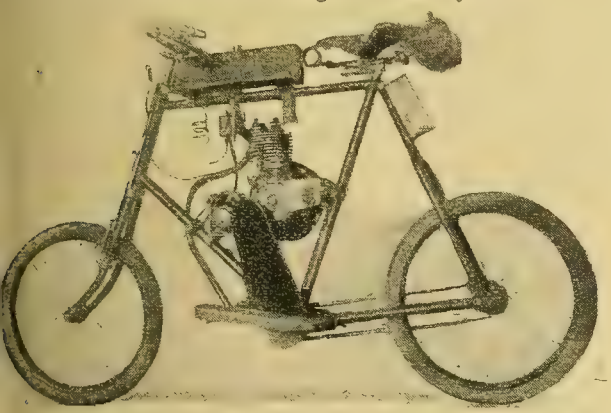
Glasgow. REVS.

HIPPO HIDE AND A MOTORISED BICYCLE.

Sir,—I was much interested in a photograph of "An Ingenious Motorised Bicycle," which appeared in *The Motor Cycle* dated June 3rd. My interest lay in the fact that for the past three years I have been riding a similar outfit made up by myself, the method of attaching the engine being very similar.

I am still using the original cycle frame, but with 20in. Autowheel rims. I find these wheels much stronger, and tyres are better also. I scrapped the pedals and brazed a piece on to the end of the bottom bracket axle, and fixed the sprocket wheels on both ends, and thus made an all-chain drive. The footboards are from locally cut cedar wood, and I have fitted the engine to the frame with a specially shaped and carefully fitted piece of *hippopotamus hide*, which is splendid stuff to stand any strain, as it does not split or tear. I use it for file handles (it goes up to 2in. in thickness).

I think this is the first instance in which hippopotamus hide has been used in the making of a motor cycle.



A Rhodesian reader's motorised bicycle described in the letter of J. W. Soper. The engine is held in the frame by pieces of hippopotamus hide.

We have only one road here, viz., to Livingstone, but it s a good one and eight miles long.

I can get 25 m.p.h., as my gear ratio is 7 to 1, much higher han that of your other correspondent, whose engine, I should ink, would be inclined to overheat. J. W. SOPER.

South Rhodesia.

STHEY DID TWENTY YEARS AGO.

Sir,—Your issue for September 23rd contains some informa on regarding the Roc 3 h.p. Kelecom engined motor cycle. his article I have to thank for affording me considerable lightenment as to the makers of my own 'bus.

My machine has L.T magneto (with substantial magneto ntact breaker and non-trembler coil) ignition system, hich has proved perfectly reliable in dry weather.

I myself made and fitted spring forks, foot brake, long haust pipe, etc.

I just completed my overhaul and "rebuilding" in time r my holidays. So close did I run that, previous to my liday trip, I had no time for a trial run. My contemplated n was from Gateshead-on-Tyne, through Easingwold to eslerton (near Scarborough), nearly 100 miles. I intended ving Gateshead early on the Saturday morning, but only cceeded in having a "breakdown" to start with. The inlet tomatic valve stem nuts loosened, and finally came off, owing the valve itself to fall on top of the exhaust valve. e nuts were extracted from above the piston and a washer ade from an old hack-saw blade) and pin substituted on the lve stem.

I covered about five miles when the washer and pin repeated e performance of the nuts. I removed the induction pipe, , hooked the inlet valve spring itself through the pin hole ad previously drilled in the valve stem, removed washer, , from the cylinder, reassembled, and started once more ill southwards).

The ten miles ride to Darlington was uneventful. I ained more petrol and oil, and did the next thirty miles hout the slightest trouble from the machine. As I left rlington, however, it began to drizzle, rapidly settling vn to proper rain. I made a voluntary stop in Thirsk. On trying to restart the engine refused to fire. It was still raining, so I suspected the high-tension cable terminal on the coil. I therefore dried this as best I could, after which a restart was easily acccomplished. About two miles after this my belt began to slip hopelessly. However, under a sheltering tree I removed about 1½in. of belt whilst watching competitors returning from Sutton Bank. This operation completed, I set off again. About three miles before reaching Easingwold the rain on the high-tension terminal repeatedly caused stoppages, till finally, with still two miles to go, I removed the belt, and pushed in preference to restarting.

Eventually I put the machine in the garage in Easingwold at 9 p.m. Next morning I went for the machine, which, to my surprise and pleasure, restarted without the slightest inconvenience. I hit Bulmer Bank all right; one cannot help it (unless, of course, one purposely avoids it). I had to do a bit of really hard work, but I did reach the top eventually. Here I noticed the petrol tap was leaking seriously. I could not do much to remedy this as it was the tank bush that was loose. Here also I had partially to dismantle the engine cylinder to renew the copper wire packing at the base of the cylinder. On remounting, after completing the above, I caught my trouser leg in the magneto chain, which is exposed. The ignition was most effectively retarded thereby; but a certain farm hand had been holding forth as regards petrol levels during the hill-climbing, etc., so I rode away on retarded spark to a safe distance before correcting it. I had two further mishaps before I reached Malton—one a broken stand, the other the inlet valve. The hooked portion of the spring gave way this time. I stretched the spring a little, made a more substantial hook, fitted up, and off once again. After passing through Malton the cylinder again worked loose, but, as I just had about eight more miles to go, I determined to keep on, as the petrol was still leaking badly. When almost within sight of my destination, I pushed the throttle over, and finished up in fine style after all.

ROBERT BROWN.

BENZOLE-PARAFFIN MIXTURE.

Sir,—In the issue of September 9th, 1920, C. C. King states that he is running a 4 h.p. Triumph on a mixture of three parts benzole to one part paraffin, and that the experiment is a wonderful success. Further that he tried half and half.

May I ask what carburetter he uses and size of jet?

I have tried, in the interval, similar mixtures, and cannot say that the results are equal to benzole or petrol in a pure state. My machine is a B.S.A. 4½, and a B. and B. carburetter is used, having a variable jet.

DAVID SHARP.

PILLION RIDING.

Sir,—I agree that there is a risk of danger when riding a passenger on the carrier of a solo machine; but if people were to consider the cause of practically 80% to 90% of the accidents which befall pillion riders they would find that the real cause lies in the fact that the driver was not sufficiently experienced to carry out such work. He probably thought he was, and after a short run on some straight and open road took it for granted he was quite capable. I have in mind one or two actual happenings of this kind which had bad results when traffic was encountered.

Before any newcomer attempts passenger riding he should master his machine first, get thoroughly acquainted with traffic riding, and in this way he will learn to judge distances and the speed of vehicles other than his own. He will also know what his engine is capable of at slow speeds, and whether it and his brakes will respond to his needs. This, coupled with a few frights, gives him the experience, which, I believe, is so sadly lacking in many motorists who like to take their friends out in pillion fashion.

An experienced rider will not find pillion riding very difficult, and after a week or so his passenger's movements and conversations will make practically no difference to the stability of his machine, and there is no more risk of accident than with any other outfit.

I myself have had fourteen years of motor cycle and sidecar outfits, and certainly prefer a sidecar outfit; but I write these lines in defence of the man who prefers pillion riding.

I ride at present a T.T. Brough two-speed, and no clutch, and do a lot of pillion riding. I have no difficulty in negotiating the worst traffic, and I think the whole explanation can be summed up in these words, experience first and drive carefully.

F. KIRKMAN.

BABY ON TOUR.

Sir,—Having taken delivery in January of a brand new 1920 baby, the accompanying snap may be of interest to others who hesitate between the responsibilties of motherhood and the lure of the open road.

Having always been ardent motorists, my husband and I decided to have our usual summer tour, accompanied this time by "Her Babyship."

Before starting the tour, we gave her a number of short runs of ten-fifteen miles (she was then seven months old). Having expressed herself quite satisfied with the springing of the sidecar, etc., we decided to carry out our plans.

Starting early. (See letter, Mrs. R. J. Carter.)

Our first day's run was Portsmouth to London, which was soon covered, taken by easy stages of fifteen-twenty miles each. The Cameo screen gave baby ample protection, in fact, the only time she woke was at the stopping places. All baby's necessities were carried in her enamel bath on the luggage grid. In the course of visiting London friends we had to cross the City four times, which greatly interested the young lady, especially at the "hold-ups," where she had time to look round.

We completed the tour in seven days, covering a respectable mileage, and without mechanical or infantile trouble of any kind.

I may add she was caught a little while ago "inwardly digesting" the covers of your esteemed paper, so we are expecting big things of her. The above snap was taken on the Hog's Back, near Guildford.

(Mrs.) R. J. CARTER.

CHAIN DRIVE ON SPRING FRAME MACHINES.

Sir,—Permit me a word on this subject, as bearing upon the remarks of recent letters, and particularly that of G. Harold Durston in the issue of August 26th. It would appear that many have begun quite recently to consider a problem which, though to them new, has, as a matter of fact, received attention over quite a number of years, and passed already through many stages of development. I, of course, fully agree with your correspondents as to the necessity of maintaining constant tension of the driving media, notwithstanding the relative movements of the fore and rear portions of the spring frame.

While I do not pretend to know what may be the nature of the mechanical arrangements suggested, but not disclosed, by Mr. Durston, for achieving this object, I do profess to have applied and published a most obvious and simple arrangement of the parts involved, which is entirely satisfactory, both in theory and in practice.

As briefly as possible, I will endeavour to state how this is achieved, not going fully into detail, but giving the general principle. There are the three points to consider (1.) The [illegible] (2.) The countershaft. (3.) The rear wheel sprocket, or belt drum. These, by the general build of the [illegible] that a straight line drawn from the engine to the rear wheel spindle will cut through the point occupied by the countershaft spindle when the machine [illegible]

In one arrangement I house my countershaft (preferably of the well-known ball type, in what, in bygone parlance would be called the pedal bracket lug, *i.e.*, a lug-housing at the root of the saddle-pillar tube, and forming also the anchorage for the rear engine-plates. The countershaft housed in this way may be immovably fixed, or may be mounted eccentrically or slidably if of a type where such movement is most practicable.

First let the countershaft be fixedly housed. Now the distance between the engine sprocket and the countershaft is constant. I swing or pivot the forward ends of my rear spring frame upon a suitable bearing formed by or upon the casing surrounding the countershaft spindle and housing that spindle *in its centre*. Consequently, all radii of a circle being equal, there can be no variation of the tension of the chain or belt as between the countershaft and rear wheel, even though the rear portion of the frame were caused to describe a complete circle around its pivot.

In another arrangement the countershaft may be housed in approximately the same position, but in a lug not of the pedal bracket type, but so formed as to permit of a slidable adjustment, the bearing for the forward ends of the rear frame being still, as before, around the countershaft spindle and having that spindle at its centre.

We now come to adjustment for the chain slack. Under the first arrangement (fixed countershaft) I mount my rear wheel in the old-fashioned slotted fork ends, providing positioning washers to retain the spindle of the wheel in the desired position. I know the objections to this method, but one cannot possibly have everything. For adjusting the front chain, I either use a jockey sprocket (*à la* Beardmore-Precision), or suitably slot my engine plates so that the whole unit (within the very narrow limits required) may be slid or pivoted upon its front bolts.

In the second arrangement, when the countershaft is adjustably housed, the rear wheel is fixed, and for the front chain adjustment the same methods as the above are employed. These arrangements answer all purposes desired perfectly as applied to my patent designs of spring frames; and I venture to think that the problem of keeping constant the tension of the driving media, the relative movements of the front and rear portions of the frame notwithstanding, is thereby solved satisfactorily. C.E.P.

Bath.

SERVICE.

Sir,—I am a business man, and use, in connection with my business, a big single, to which is attached a box carrier made by the makers of the single. Having trouble with my countershaft gear, I sent the complete gear box, through my agent, to the makers, who had promised to do the repairs in eight to ten days. It was despatched on June 1st, and is still to return. Every letter of enquiry brings back a promise of delivery next week. But next week is like to-morrow, which never comes. Consequently, I am the loser in time and money each week to the extent of about twelve hours wasted and 30s. From being a satisfied rider I have become a dissatisfied owner. A machine without good service is of no use to A BUSINESS MAN.

TORQUE AND COMFORT.

Sir,—It is interesting to note the large number of new designs for motor cycles, engines, etc., that appear in your columns. To my mind, as an engineer, many of these designs are the work of enthusiastic *motorists*, and aim chiefly at improvements of "luxury" and "comfort" without giving much serious attention to the strictly engineering side of the question, which I maintain is really the principal factor. For example, most of the designers are paying great attention to the "springing" of machines to ensure comfortable riding. Now I consider that the obtaining of an even driving torque would do away with much of the necessity for this springing. To those who have any doubt on this point I would advise them to try the following: Ride over a given stretch of fairly rough road on any old "unsprung" single cylinder machine, and then try the same stretch on an old four-cylinder F.N. machine. This, I think, will convince them of the importance of an "even driving torque" as effecting comfortable riding with a minimum of springing. With this end in view I have designed an engine which is double acting, viz., firing on each stroke, the piston being "fired" up and down, similar to the action of the present day double acting steam engine. In the meantime I should like to have the opinion of readers as to the possibilities of such an engine. A. NEWSHAM.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

The New Taxation.

I should be extremely obliged if you could give me a little enlightenment on the following point. I understand that under the new taxation scheme, a lightweight motor cycle pays 30s. revenue, provided that it does not exceed 200 lb. in weight. Now, I have a single-geared 3½ 'bus which with the removal of a few gadgets I can easily reduce to under 200 lb. What I want to know is, can I class my old 'bus as a lightweight, on account of its not exceeding the weight limit, or will it be taxed on bore and stroke?—PUZZLED.

Obviously as weight is to be the basis of taxation, and not engine dimensions, if your machine does not exceed 200 lb. you are only liable to pay the 30s. tax. If the machine exceeds 200 lb., no matter what its power, it will be liable to the £3 taxation.

Overheating Two-stroke.

I have a 2½ h.p. two-stroke two-speed. I have just had the cylinder off, decarbonised it, and fitted new rings on the piston. Before I did this the engine used to overheat and stop, and it also consumed a lot of petrol. The size of the jet in the Senspray carburetter is 30. I have now cleaned it and fitted new rings and a smaller jet. It overheats worse than it did before, and does not seem to have half its previous power, as I only go a short distance, and it pulls up with the oil boiling out of the release valve. I have allowed about 5-1000ths space in the rings, and ground them in well. The piston appears to work freely. The engine seems very jumpy, especially when I slow down going round corners. Can you please tell me the cause of this, and what size jet to use? I have put the piston in right, with the big slant towards the exhaust.—F.N.

It is very difficult to tell you the cause of the trouble. Quite possibly the carburetter requires cleaning and adjustment. Most decidedly it should not require a No. 30 jet. You might also make certain that the ignition is timed correctly. The spark should occur when the piston is on top dead centre with the ignition control fully retarded. Also carefully make the joints between the two halves of the crank case, and also the one at the cylinder base. We presume that you have examined the engine internally to make sure that the crankshaft revolves freely. A 26 or 28 jet should be satisfactory.

Burnt Valves.

I have a 5-6 h.p. Rudge-Multi and sidecar. I experience a great deal of trouble with the exhaust valve. After about 400 miles the compression begins to fail and I find a flat place burnt on the valve face. I have checked the timing, and it appears to be quite in accordance with makers' instructions. Senspray carburetter, 48 jet; have tried smaller jet, but with no success. Valve guide rather worn. Machine runs very well when valve is in order, but the flat burnt on the valve is so extensive as to make it of little further use. Machine is 1913, but in quite good order generally. Can you help me?—B.S.

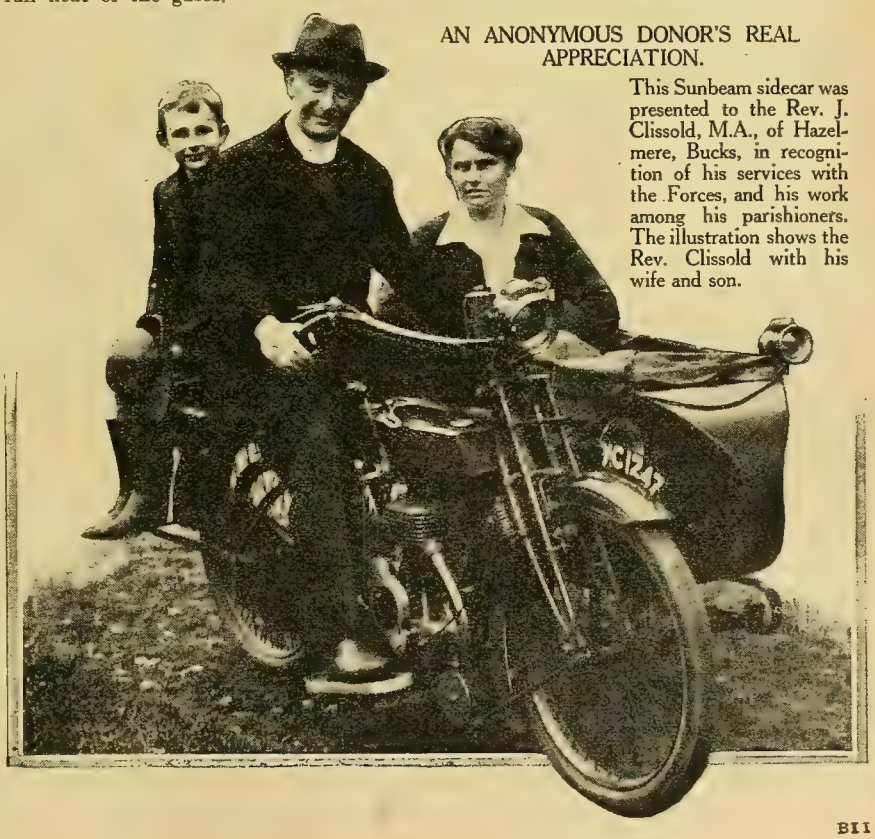
The trouble is probably due to the exhaust tappet requiring adjustment. Should the clearance be too small there is every chance that the valve stem will expand so much as to prevent the seating closing down properly, and in consequence it becomes burnt, being subjected to the full heat of the gases.

Failure to Spark.

I have a 3½ h.p. Centaur, and, owing to back hub trouble, have had it off the road for six weeks, and have just got my wheel back, and find that: (1.) I can only get a spark when the plug is outside the cylinder. (2.) If I dip the plug in petrol, this spark *is* sufficiently strong to fire it; the magneto is a Bosch. (3.) What is the correct method of timing? (4.) Would this materially affect the spark when the plug is in the cylinder?—G.A.B.

(1 and 2.) From what you say in your letter it appears that the magneto is in order. (3.) The ignition should be timed as follows: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break, and the ignition lever two-thirds retarded. (4.) The trouble is probably elsewhere than in the magneto. Are you sure that the jet is clear? The timing cannot affect the intensity of the spark.

AN ANONYMOUS DONOR'S REAL APPRECIATION.



This Sunbeam sidecar was presented to the Rev. J. Clissold, M.A., of Hazelmere, Bucks, in recognition of his services with the Forces, and his work among his parishioners. The illustration shows the Rev. Clissold with his wife and son.

Douglas Timing Gear.

I have just fitted a new timing locking plate to my 1915 2¾ h.p. Douglas. Will you kindly inform me if the following is the correct method? I fitted the plate on to the studs first, then the washers and nuts. This has left the plate touching the timing wheels, etc., at every point, although they apparently revolve freely. The reason I enquire is that the washers are of a different pattern from the original ones, and only fit after the plate.—R.R.H.

Up to 1914 tapered copper split rings were inserted and the nuts placed on the pins afterwards. In 1915 and afterwards double cone locking washers were fitted. These are put on first, then the locking plate, and then the nuts.

A Starting Difficulty.

(1.) I cannot get the kick starter of my R.A.F. model P. and M. to work properly, and have only succeeded in starting the engine by it a very few times. Starting by pushing in low gear is quite easy. The kick starter turns the engine well, but does not appear to me to have sufficient travel. (2.) I have tried all means of stopping the escape of gas from the inlet and exhaust valve caps, and round the plug, without success. New copper-asbestos washers make very little difference. The faces do not appear to be damaged.—E.N.E.

(1.) The kick starter in question does not give a very great amount of movement to the engine, but with the half compression device in operation, there should be no difficulty in starting. It is possible that the difficulty is due to the magneto being out of adjustment, and not providing a satisfactory spark at low speeds. Advance the ignition fairly well before attempting to start. (2.) Try the effect of smearing the washers with Seccotine.

High Petrol Consumption.

I have a 2¾ h.p. New Ryder-Villiers two-stroke, and the carburetter is an Amac. So far as I can make out, the average m.p.g. is 40 at the most, which, I am sure, is far too small. (1.) What should the average m.p.g. be for this type of engine? (2.) What is the cause of this excessive consumption? (3.) Is there a remedy? If so, what? (4.) In what proportion should the oil and petrol in the tank be mixed, and which is the best oil? (5.) What is the correct level in comparison with the mouth of the jet, for the carburetter?—H.J.M.

(1.) The machine should do about 80 or 90 miles to the gallon. (2 and 3.) Probably too large a jet is fitted. (4.) Half a pint of oil to one gallon of petrol. Any [illegible] brand of oil, such as Prices' Heavy de Luxe, Castrol, or Vacuum T.T. (5.) In the Amac carburetter the level is [illegible] the angle jet orifice, and [illegible] about [illegible] on below the [illegible] immediately above the [illegible] jet is required [illegible] but you will be [illegible] the working heat if you adjust up to [illegible] needle, so that there [illegible] play between the float and the needle spring clip.

Contact Breaker Trouble.

I am the owner of a machine fitted with a U.H. magneto and have been for months experiencing a most peculiar trouble. At times the machine will start with one pull of the starting handle, and other times I may turn the handle for hours without the slightest result. To cure this I widen the gap of the platinum points and the machine will then start every time and run beautifully for about fifty miles, then the old trouble recurs. The engine in all other respects is perfect.—W.P.

As a temporary cure is effected by re-adjusting the platinum points, it would appear that this is the source of the trouble, and we would suggest that you ascertain whether it is caused by the points themselves wearing down, or the adjusting screw moving from its position. If the points themselves are wearing, it will be necessary to have new ones fitted, but if it is the adjusting screw which has become loose in its thread, we would suggest that you have a new one made.

IMPORTANT DATES.

Nov. 4th-13th—
International Automobile Exhibition, Olympia and White City

Nov. 29th.-Dec. 4th—
Olympia Motor Cycle Show.

Dec. 26th-27th—
M.C.C. London-Exeter Run.

Difficult Starting.

My machine is a 1912, 3½ fixed gear Triumph, which up till lately has been running very well. Now I have great difficulty in starting even after priming the engine. When it does start it goes for about a mile, then suddenly conks out. I have then noticed smoke coming from the air chamber of the carburetter. I get a good spark at the plug, and have taken down the carburetter which seems in good order. Can you suggest a possible cause of the trouble?—A.J.T.

The trouble may be due to an unsuitable plug which is causing pre-ignition. The difficulty in starting, however, does not seem so easy to diagnose. It may be due to air leaks at the carburetter or induction pipe unions.

READER'S REPLY.

I have read with interest "P E.T.'s" letter on "Mysterious Lack of Power." I suffered recently in a similar way, my machine being an Omega-Jap, with only a very small mileage, I eventually found that the holes in the cylindrical silencer with which 2¾ h.p. J.A.P. engines are usually fitted were choked with soot, and on poking these out with a pricker my trouble disappeared.—W. L. HOUGHTON.

EXPERIENCES WANTED.

"F.J.S.M." (Brixham). — T.B., Richardson, and G.N. cycle cars; speed, reliability, climbing, and consumption.

SPARKLETS

Easting Windscreens in London.

The Easting Windscreen Company has opened a depôt in London, at 24, Finsbury Square, E.C.2, under the control of Mr. H. W. Holmes, late of Maudes Motor Mart and also of the Harley-Davidson Motor Co.

Two-stroke Lightweight in Africa.

Cabled information advises that in a reliability trial for lightweights organised last month by the Rand M.C.C., the winner was mounted on a 2¼ h.p. Royal Enfield two-stroke. The success of such an event, over a hundred miles of typical South African roads, is ample proof that lightweight machines are practical mounts for Overseas conditions in almost all cases.

A Three-wheeled Scooter.

A booklet has recently been published entitled "The Abbottsford Motor Supa Scoota," giving full details of the only three-wheeled scooter on the market. These scooters can be delivered in one month from the date of order. A copy of the booklet will be sent to any reader on application to the Abbotsford Motor Scooter and Engineering Co., Ltd., 5a, Surbiton Road, Kingston-on-Thames.

Humber Agents Entertained.

Some 150 motor dealers and agents who handle Humber products were invited to the Coventry works of the firm in order to view the new models which will be staged at Olympia. They were welcomed to lunch by Lord Russell (chairman of the company), and a discussion on the firm's policy took place, in the course of which it was stated that, despite the reported depression of trade in some quarters, it was even yet impossible to fulfil all the demands which were being made for the various products of the Humber factory.

Brooklands Speed and Distance Table.

We have recently received a new Brooklands speed and distance table, compiled by Lieut.-Col. Lindsay Lloyd. The first part of the book is devoted to speed tables for cars running on the 50ft. line, and the second part of the book to speed tables for motor cycles running on the 10ft. line. The time of the laps is given in seconds, opposite which are the miles per hour; for instance, a lap in 97s. equals a speed of 100.65 m.p.h. Lap distances are also given; for instance, one lap on the 10ft. line means a distance of 2 miles 1,263 yards. Another table which is quite interesting is the mileage expressed in laps on the 10ft. line. One hundred miles, for example, means 36.80 laps, or 18 laps, 1 mile 144 yards. Interesting facts are also given regarding Brooklands test hill, and at the beginning of the book there is an excellent plan of the track.

Club News

North London M.C.C.

The theatre night at the London Coliseum on the 16th inst. was very successful, upwards of sixty stalls being occupied. After the performance the party adjourned to the Corner House to partake of light supper.

The winter programme is under consideration, and will probably consist of three outdoor events, in addition to several social functions.

Glasgow Western M.C.C.

Last week we gave a brief report, received by wire, of the speed-judging competition for the Bates Trophy. Later information reaches us that D. S. Alexander, who was given as Trophy winner, is not now placed. J. Littlewood (6 A.J.S.) therefore takes first place, with a total time error of 6m. 55⅘s., and the third and fourth men of last week, G. Hope Wilson and R. A. Law, become second and third respectively.

Doncaster M.C.C.

The Doncaster M.C.C.'s mid-season dinner took place at the Red Lion Hotel on a recent evening, the president, Mr. Joseph Franks, J.P., C.C., being in the chair. Nearly every one of the club's hundred members were present, and the atmosphere was distinctly sporting—typical of what a motor cyclist's dinner should be. Later, the trophies, medals, and prizes were presented. Included in these were four silver cups, one being *The Motor Cycle* trophy. This was won by Mr. F. B. Leach, on a Scott, when he made the fastest time of the day at the club's first speed trials on the road adjoining the racecourse. The trophy was last won by Major Axford in 1914. A most enjoyable musical programme followed.

Colchester and District M.C.

The results of the hill-climb held on Thursday, October 14th, near Lawford, are as follows:

EVENT 1 (up to 350 c.c.), on formula.—1, A. Medcalf (2¾ Douglas); 2, R. W. Tracy (2¼ Enfield); 3, H. Collins (2¼ Levie).

EVENT 2 (sidecars up to 650 c.c.), on time.—1, T. S. Wilkin (4 Norton sc.), 23⅘; 2, R. W. Tracy (4¼ B.S.A. sc.), 29⅗s.; 3, H. Cook (4 Triumph sc.), 37s.

EVENT 3 (sidecars up to 750 c.c.), on time.—1, R. C. Charlesworth (5 Zenith sc.), 19⅗s.; 2, T. S. Wilkin (4 Norton sc.), 26⅘s.; 3, R. W. Tracy (4¼ B.S.A. sc.), 30s.

EVENT 4 (sidecars up to 1,000 c.c.), on formula.—1, T. S. Wilkin (4 Norton sc.); 2, R. C. Charlesworth (5 Zenith sc.); 3, R. W. Tracy (4¼ B.S.A. sc.).

EVENT 5 (1,000 c.c. solo), on formula.—1, R. C. Charlesworth (5 Zenith); 2, A. Medcalf (2¾ Douglas); 3, H. Cook (4 Triumph).

EVENT 6 (650 c.c. solo), on time.—1, A. Medcalf (4 Triumph), 18⅘s.; 2, H. Cook (4 Triumph), 23⅕s.; 3, R. W. Tracy (2¼ Enfield), 27⅕s.

EVENT 7 (750 c.c. solo), on time.—1, R. C. Charlesworth (5 Zenith), 17s.; 2, A. Medcalf (4 Triumph), 19⅘s.; 3, C. Collins (5-6 Indian), 22⅘s.

FASTEST TIME of the day was made by R. C. Charlesworth (5 Zenith) in 17s.

Week-end Club Events.

Oct. 30.—Surbiton and District M.C.C. Ballard Cup Trial.
Oct. 31.—Reading and District M.C. and L.C.C. Club Run.
Oct. 31.—Ilkeston and District M.C.C. Special Day Run.
Oct. 31.—Stalybridge and District M.C. Hill-climb.
Nov. 4.—Colchester and District M.C.C. Speed Trials.

The Motor Cycling Club.

On the occasion of the One Day Sporting Trial on the 16th inst., fully described in our last week's issue, the following gained gold medals: J. T. Bashall (6 Martinsyde), G. Gayford (6 Zenith), R. H. Baxter (2¼ Radco), R. C. Staunton (4 Triumph), and S. Guy (2¾ Coulson). The case of F. W. Stevenson is under consideration. Only five gold medals, therefore, have been awarded out of seventy-two starters, which was mainly due to the appalling condition of Chalk Pit Hill.

Southend and District A.C.

We gave the results on time and the awards of the speed trials near Shoeburyness in our issue of last week. The formula placings are now to hand, and are as follows:

CLASS 1 (350 c.c.).—1, N. A. Lowe (2¾ Diamond-Jap), 34.79; 2, J. Cockerill (2¾ Coulson B.), 46.2.

CLASS 2 (500 c.c.).—1, G. H. Stewart (3 A.B.C.), 33.45; 2, N. A. Lowe (2¾ Diamond-Jap), 35.4.

CLASS 3 (unlimited).—1, G. H. Stewart (3 A.B.C.), 35.7; 2, N. A. Lowe (2¾ Diamond-Jap), 38.3.

CLASS 5 (500 c.c. sidecar).—1, N. A. Lowe (2¾ Diamond-Jap sc.), 28.48.

CLASS 6 (1,000 c.c. sidecar).—1, N. A. Lowe (2¾ Diamond-Jap sc.), 27.6.

CLASS 8 (1,100 c.c. cycle cars).—1, Austin Webb (4 A.S.C.) and W. Whiffen (8 Morgan) tied, 38.2.

Levis Athletic Club.

The Levis Athletic Club is holding a concert at the Levis Works, on Saturday, November 6th, when the prizes won in the recent Levis Reliability Trial will be awarded. Tickets, price 2s., 1s., and 6d., plus tax, can be obtained from Mr. G. W. Reynolds, c/o Levis Works, Stechford.

Another Surrey Motor Cycle Club.

It has been decided that a motor cycle club should be formed in Wallington, Surrey. Several challenge cups will be offered for competition when the club attains sufficient members, and, for the present, particulars can be obtained from Messrs. Houghton Bros., motor engineers, Woodcote Parade, Wallington.

Birmingham M.C.C.

The tie for the Olai lightweight trial was settled on the 16th inst., on a course from Birmingham to Farlow. At Farlow the competitors had to traverse the Farlow loop six times, the competitor who had the greatest non-stop mileage to his credit being the winner. A puncture stop did not penalise the competitors, as such had to be repaired under official observation, travelling marshals officiating for this purpose. The wet weather made the course rather tricky, but it is satisfactory to know that a winner was found without putting in any special tests. The results of this trial have been decided on *reliability* alone.

Winner of Olai sideboard, value 26 guineas, G. Kuhn (2½ Levis); winner of Hoskison award, value 5 guineas, E. J. Bastock (2½ Levis). Both of the above prizes are won outright.

The start of the Birmingham M.C.C. Re-run Lightweight Trial, the course of which was six circuits of the "Farlow loop." The event was won by G. Kuhn (Levis), on extreme right of group.

CURRENT TOPICS

Times to Light Lamps.

Rev. Bischoff leaves the Clyno.

The Rev. P. W. Bischoff, who gave up the Church to enter the motor cycle trade, will, in future, be associated with Sunbeam motor cycles, having joined the staff of John Marston, Ltd.

The Craze for Luxuriousness.

It is passing strange that the motor cyclist should be all for complete electric lighting sets as an integral part of his mount, and yet the light car owner in a recent *Autocar* bemoans the fact that it seems impossible to buy a good two-seater *minus* electrical equipment. Will we ever reach that stage?

Ten Standard Steels.

All those who desire copies of the Report of the Steel Research Committee of the I.A.E. on the ten standard steels published in Report No. 75 of the British Engineering Standards Association, are asked to make early application to the secretary of the Institution, at 28, Victoria Street, London, S.W.1. The price of the report is 33s., including carriage.

The Institution of Automobile Engineers.

A paper will be read on the report referred to above, by Mr. J. H. S. Dickenson, at the general meeting of the Institution at Storrey's Gate, London, S.W.1, on Wednesday, November 10th.

Point-to-point Records in U.S.A.

Point-to-point records are permitted in America. In May last F. Clymer (Henderson) established a record of 19 m.p.h. average for the 1,224 miles between Denver and Chicago. Last month H. Scherer on a Harley-Davidson beat his record by 7.4 m.p.h. The mileage of Scherer's route was 1,260, and his average speed 26.4 m.p.h.

Meanness.

I. Z. Love in one of his latest books recently finds the limit in this direction reached by the man who saves his tobacco-tin for Queen Alexandra Day the following year. Probably he has not heard of the frugal gentleman who habitually obtains a day or two's free garaging by ordering some very minor adjustment, and returning for the machine only when he requires it again.

Found.

Messrs. Quinby Bros., 15, High Street, Baldock, Herts., advise us of having found a pillion seat on the road between Baldock and Biggleswade. Enquiries direct, please.

Stolen.

Bromley, Kent, is the scene of yet another motor cycle theft. This time it is a 1920 4 h.p. Triumph, registered No. D.C. 1634, with semi-T.T. bars (bent), and throttle lever nearly broken. An undershield was fitted, and a Klaxon horn secured by a strap. A £12 reward is offered by Messrs. G. Dix and Co., 11, Grocers' Hall Court, Poultry, London, E.C.2, for information leading to its recovery.

The 3½ h.p. Sidecar Outfit.

In view of the general tendency for makers of single-cylinder machines to increase their capacity slightly for sidecar work, it is interesting to recall that the best sidecar performance in the recent M.C. and A.C. Trial—the most severe of the year—was made by a 3½ h.p. Ariel outfit. It was the only sidecar to make a clean ascent of Alt-y-Bady without the passenger on the carrier.

Weights.

Next year motor cycles of under 200 lb. in weight will be taxed 30s., over 200 lb. 60s., and sidecars 20s. extra. Everything else being equal the difference in a few pounds may influence the purchase of a new machine, therefore it behoves makers to give the accurate weight of their productions. Approximate weights serve no purpose, but apart from the question of taxation it is desirable that every maker should take care to include weight in detailing his specifications.

Special Features.

NEW MODELS.
THE DEVELOPMENT OF THE SIDECAR.
OVERSEAS.

Registration Marks.

Nottingham County Council has been allotted the letters NM in addition to the present AL.

A Step in the Right Direction.

In view of recent complaints of obstruction on the road by lorries and chars-à-bancs, a trailer in the service of Maples, the furniture people, is worthy of careful note by other transport contractors. It has an elevated compartment in the extreme rear, giving an unrestricted view in all directions—very reminiscent of French railway brake vans, and, presuming the occupant to possess means of communicating with the driver, very useful, too.

Trials Results.

Most official lists of awards contain errors in the spelling of names or the makes of machines. In fairness to riders and makers we have to correct two errors, which are not our own. H. J. Willis, who won the special prize for best performance by a private owner in the M.C. and A.C. trial, rode a Norton, and not an Ariel, as stated last week; while S. Lunn Whitehouse (3 A.B.C.) won a silver medal in the recent West Midland event.

40,000 Motor Cyclists in London.

During the quarter ending September 30th, 1920, 2,581 motor cycles were registered by the London County Council, while the total number of motor cycle registrations up to September 30th amounts to 39,701.

The total number of motor car and motor cycle licences to drive issued during the quarter ending September 30th was 24,567, while the total up to September 30th was 185,706.

A Reunion Dinner.

Officers who served at the engine repair shops, Royal Air Force, France, are holding a reunion dinner at the Holborn Restaurant, London, on Friday, 12th November. This is being held during the Motor Show period to suit the convenience of those attending, the officers of the depot in question being, in practically every case, associated with the motor industry. Full particulars can be obtained on application to D. Drover, A.M.I.A.E., Room A.243, Air Ministry, London.

An Internal Combustion Turbine

In Germany there are motor boats fitted with internal combustion turbines of quite moderate size. Shall we ever see them on motor cycles?

M.P.G.

We have now received details of the recent A.C.U. observed test (referred to on page 425 in our issue for October 7th) of a P. and M. motor cycle fitted with a standard mechanical oil pump, which consists of a small reciprocating plunger driven at one-fortieth engine speed, and delivers a definite quantity of oil alternately to cylinder and crank pin at each half-revolution.

The carburetter is fitted with an Amac, type HYD, with overhead feed and a No. 28 jet, while the gear ratios were 4.83 and 8.89 to 1. A non-stop run of 54¼ miles, at an average speed of 19.04 m.p.h., was made to Oxford. The return journey was made at an average speed of 20.09 m.p.h. The petrol consumption for the 112½ miles was at the rate of 144.6 m.p.g., and the oil 1,125 m.p.g.

Last week we recorded W. H. Carson's successful attack on Clovelly High Street steps. The photograph depicts him with his Excelsior sidecar negotiating the "terraces," which are paved with round stones and which were very greasy on the day the climb took place.

A Lying Jade.

For the benefit of those alarmists who feared otherwise, "Old Chalky," or Chalk Pit Hill, which proved such a quicksand in the recent M.C.C. trial in Surrey, is not to be included in the Matchless Cup trial which is to be held on November 6th.

The Cleveland for 1921.

The Cleveland is America's leading lightweight, and is quite a nice machine possessing several distinctive features. The 1921 model has a larger engine, 26×3in. tyres, and a 2¼ gallon tank, yet weighs but 175 lb. The price in America is 275 dollars.

Up-to-date Methods.

To demonstrate the utility of the kinematograph film for the purpose of British motor trade propaganda abroad, an exhibition was arranged last week by H.M. Department of Overseas Trade for the Empire delegates to the 1920 Imperial Motor Transport Conference.

The Springing of Motor Cycles.

At 7.30 to-night (Thursday) Mr. G. H. Savage will read a paper on the springing of motor cycles before members of the Institution of Automobile Engineers at the Chamber of Commerce, New Street, Birmingham. An interesting discussion should follow.

Power Alcohol.

In addition to the several papers on the fuel question referred to on this page, on the 18th inst., Professor H. B. Dixon, C.B., F.R.S., gave a paper on "Alcohol Research" at the R.A.C. The lecturer showed that the results already arrived at had conclusively demonstrated the suitability as a fuel for internal combustion engines of alcohol, which compared favourably in test with petrol and other hydrocarbons.

The Fuel Problem.

Petrol Supplies and Power Alcohol discussed at Imperial Motor Transport Conference.

INTERESTING facts regarding the fuel position and possibilities of future supplies were discussed at the Imperial Motor Transport Conference.

According to Mr. E. S. Shrapnell-Smith, C.B.E., F.C.S., M.Inst.T., the Department of Scientific and Industrial Research is alive to the urgency of the problem of motor fuel supplies and prices.

In the course of a very interesting paper, Mr. Shrapnell-Smith stated that the Research Department is in close co-operation with producers and would-be producers of new motor fuels, and that the Empire Motor Fuels Committee was willing to give assistance to any private worker in the motor fuel field of research.

Mr. Shrapnell-Smith was by no means encouraging as regards prices. He maintained that all pre-war estimates of prices of such fuels required to be at least doubled, the single possible exception under the head of fuel supply being benzole. A potential extra volume of this excellent fuel is available in this country from the stripping of coal gas to the extent of not fewer than thirty million gallons per annum, if Parliament chooses to impose on the gas consumer a small sacrifice for the benefit of the motor user.

Dealing with power-alcohol, the lecturer gave an extraordinary case of Government interference with the introduction of a new and satisfactory fuel. A sample lot of 500 gallons of a mixed alcohol fuel was shipped last summer to this country from America, but was refused clearance by the Customs authorities in London.

Scottish Shale.

Some illuminating facts were also given concerning oil. As regards Scottish shale, we were told that the combined yields of a number of refiners have never exceeded 4,500,000 gallons in one year. If "cracking," which is now so largely used in America, were adopted, a considerable portion of the kerosene gas oil could be converted into motor spirit of fair quality, and it is estimated that as much as 20,000,000 gallons per annum could be produced in this way.

Dr. W. R. Ormandy, D.S., F.I.C., M.I.A.E., M.I.Pet.Tech., has for many years been a contributor to *The Autocar* on the fuel question, and has long been an advocate of the use of power alcohol. His paper rather disposed of the theory that power alcohol is comparatively easy to produce from vegetation.

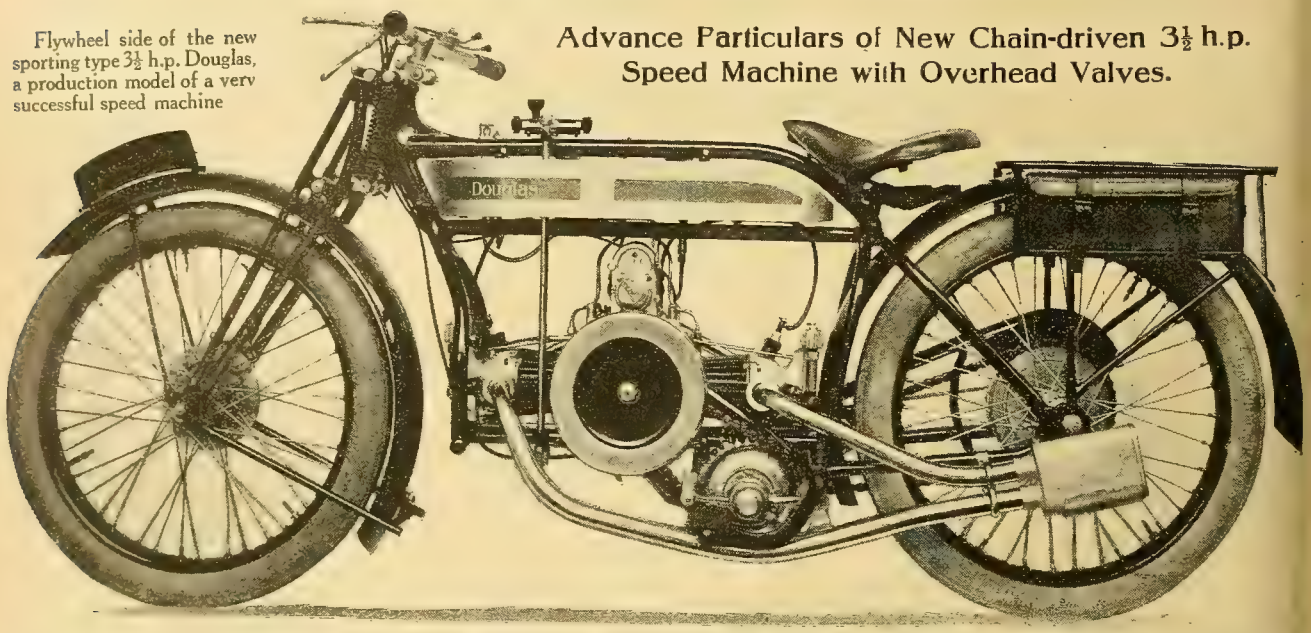
The final paper on the fuel question by Mr. G. J. Shave, M.I.M.E., M.I.A.E., engineer to the London General Omnibus Co., dealt with the first facts which have been brought before the public on the actual running conditions carried out on internal combustion engines using alcohol, or rather a mixture of alcohol and benzole. it was found that the best results were obtained from a 50% mixture and a compression of 123 lb. Summarising the tests, it was found that the greater the percentage of alcohol, the higher can the compression be raised, with a consequent rise in thermal efficiency.

It was observed that the best all-round results were obtained with a 70-30% mixture, although the 50% mixture gave quite good results.

The next best results were with a 75% benzole and 25% alcohol mixture; with petrol 7.19 m.p.g. were obtained, and 7 m.p.g. on the 50% mixture.

A SPORTING MODEL DOUGLAS.

Advance Particulars of New Chain-driven 3½ h.p. Speed Machine with Overhead Valves.



Flywheel side of the new sporting type 3½ h.p. Douglas, a production model of a very successful speed machine

EVER since Douglas motor cycles were first introduced, they have been prime favourites with the sporting element of the great motor cycling fraternity. Right from its inception, the speedy little "2¾" took a place in the front rank—in fact, it may be said to have made smaller machines fashionable among both "speed merchants" and tourists of that day, for about that time a lightweight was not regarded very seriously as a practicable mount.

Further, the early Douglas machine will always be a milestone in the evolution of the motor cycle. It was fitted with the first practical "flat twin" engine, a type which has proved to be so satisfactory that it was destined to be the prototype of many similar designs produced in every country where motor cycles have been manufactured.

These two facts make any new Douglas model of more than usual interest, and when that new model has been designed as a sporting mount—and has been proved to be exceptionally fast—there is no doubt that it will hold large courts each day at Olympia during the Show next month.

Early Successes.

The engine has been on the track, the speed hill, and the racecourse in various forms during the past year. It formed the nucleus of the machine with which A. H. Alexander put up such good speeds in the Isle of Man. For some reason the Scottish speedman could not keep his belts on. In the Grand Prix chain drive was adopted, but the combination of a really "hot-stuff" engine and chain transmission was a new proposition to the Douglas experts, with the result that valuable data were obtained concerning shock-absorbers. It has been considered by those competent to judge that Alexander would have won the Grand Prix but for a too enthusiastic spectator, who, after a roadside stop, assisted him to restart, and so caused his disqualification. His speed was infinitely superior to that of any other competitor, and many miles per hour faster than the actual winner. At the Gaillon hill-climb on the 10th inst., Alexander put up a very fine performance, securing four firsts and two seconds.

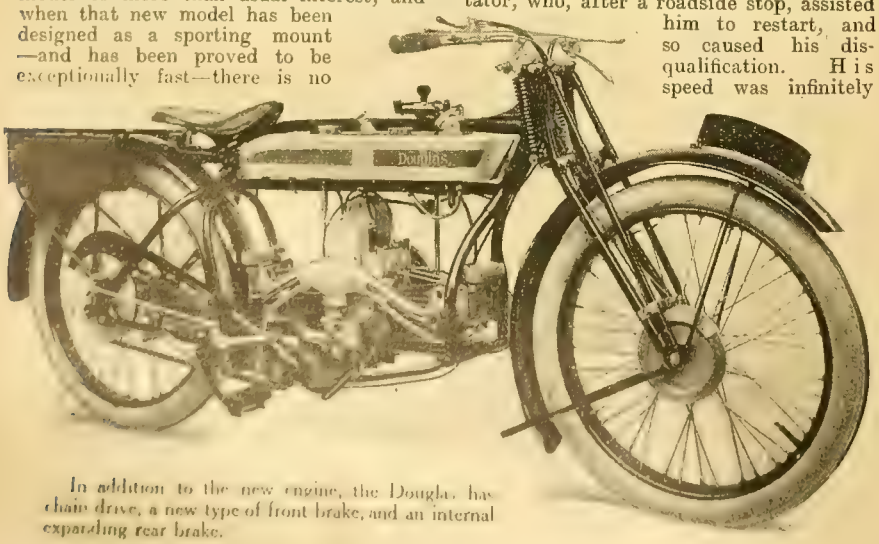
In the meantime various sample engines have been tried out at the hands of well-known riders, including S. L. Bailey, who broke several records in the 350 c.c. class at Brooklands. These were the flying five miles, 4m. 32s. (66.18 m.p.h.), and standing ten miles, 9m. 16⅘s. (64.65 m.p.h.). Bailey also secured four firsts in races with this engine. Alexander, too, secured two firsts at the Scottish speed championship meeting and at the recent Bristol open hill-climb. H. Thorpe, riding one of the new machines, gained nine firsts, three seconds, and one third, and a further six firsts in other classes in which the awards were not given, as the machine was ruled to be "not standard."

Flexibility and Acceleration.

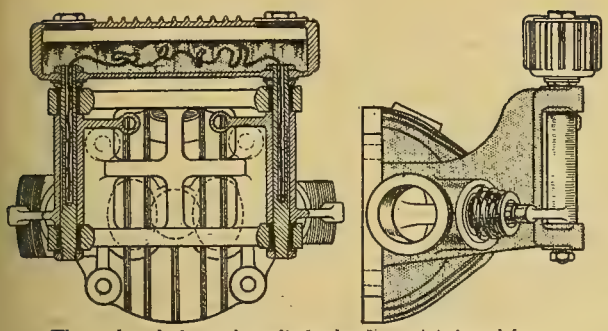
This is all the more interesting because the engines which have performed so satisfactorily are uniformly good, and have required no "faking"—that is to say, that it is not a case of a star engine out of a batch, usually difficult to duplicate, and generally impossible as a marketable proposition.

The speed of the new Douglas engine lies in its design, and any difference next year between the speeds of S. L. Bailey and the private aspirant for honours in the field of high speeds will be one of tune and skill.

One astonishing thing about this engine is that, although it is capable of remarkably high speeds, it is quite docile for traffic work, and extremely flexible. Its acceleration is wonderful, and, *sans* silencer for track work, it has an exhaust note sharp enough to please the most meticulous critic who judges efficiency by sound.



In addition to the new engine, the Douglas has chain drive, a new type of front brake, and an internal expanding rear brake.

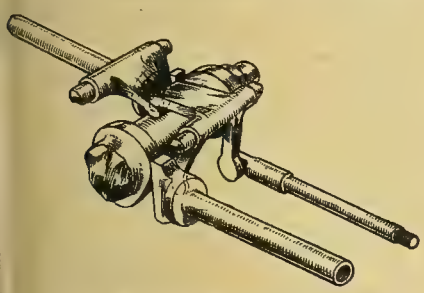


The rocker shafts at the cylinder heads are lubricated from a reservoir feeding the bearings by wicks.

Without doubt the new engine chiefly owes its efficiency to its overhead valves and its hemispherical combustion head. This, of course, is detachable, fixed by four studs, and having a flush joint with a copper-asbestos gasket.

Lubricating the Rocker Shafts.

The valves are of comparatively large diameter, and the pockets are entirely free from awkward corners which might impede the flow of the gases. Short in length and light in weight, the valves are set at 90° to each other, and are actuated directly by rockers mounted on vertical shafts carried in long bearings



The exhaust valve lifter mechanism of the new Douglas engine.

which are lubricated in a rather novel way. Over the heads of the standards containing the shafts, and forming a bridge between the two, there is a large aluminium reservoir containing oil. In this there is a long wick with its ends threaded into the rocker shafts which are drilled to receive them. From the interior of the shafts oil finds its way through a small duct to a groove on the outer surface and so lubricates the whole of the bearing. How well this system works was demonstrated to us on one of the several engines we inspected.

More or less conventional Douglas timing gear is embodied, a transverse camshaft extending across the compartment below the magneto base. The tappets and push rods, therefore, are on the upper side of the cylinders. The former are adjustable and have spherical heads which fit into the cup-shaped ends of the push rods. A similar arrangement is also provided at the rocker ends of the rods, which incidentally are instantly detachable without the use of tools.

In the engines we inspected hand-controlled drip-feed lubrication only was installed, but in the final model it is proposed to embody a mechanical pump at the head of the timing case which will give a constant supply through the drip, and the hand pump will be an auxiliary by which the rider may give an extra charge of oil when desired, without altering the adjustment of his mechanical system. Oil enters the engine at the base of the cylinders.

The cylinders are 68 × 68 mm., and on the greater part of the cylinder barrel are longitudinal fins, which diminish in area as they approach the base. The heads are amply provided with cooling surface, and have integral with them the standards for supporting the rocker shafts.

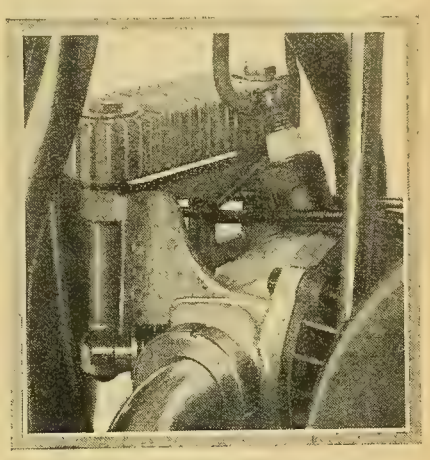
Double-row Roller Big Ends.

Cast iron pistons, with two rings are fitted, and, in order to obviate any tendency to whip, the connecting rods are of H section and rather wider than usual, but so carefully have they been designed that they are exceptionally light, being but 7 oz. each.

The big ends each have a double row roller bearing, and as the crankshaft is of the one-piece type, considerable ingenuity has been necessary in designing means for inserting the rollers, which are contained in split cages, with a two-piece retaining washer on one side.

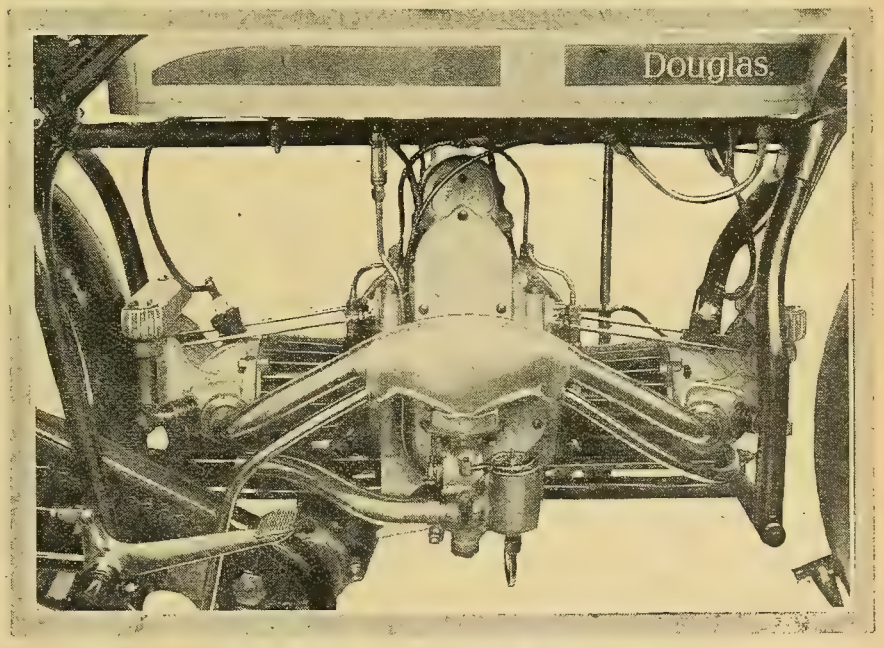
Although the three-speed gear box is new in design, many of the parts of the present 4 h.p. gear box are interchangeable with those in the new model. The kick start mechanism is on the left side of the machine, but the starting crank has been brought to the right side by means of a well supported shaft.

The frame and detail work are very good—in fact, there appears to have

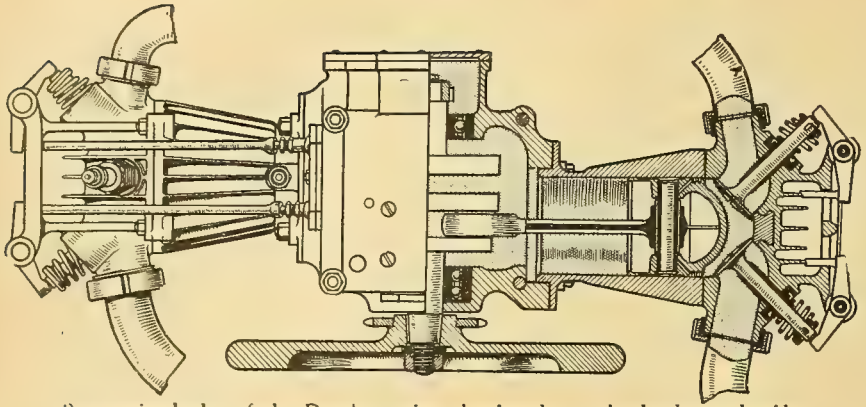


One of the aluminium oil reservoirs for lubricating the rocker shafts.

been a really serious effort to "clean up" frame design generally. Of the semi-duplex type, the frame has mostly welded joints, but the head lug, which is very substantial and extends to the fork of the front part of the frame, is brazed. The rear part of the frame is exceptionally pleasing, and leaves plenty of room for cleaning purposes. The illustrations show the details better than any number of printed words, but one little detail, worthy of mention, is not observ-



The new power unit, showing the detachable cylinder heads, overhead valve gear, and induction system. The kick-starter is fitted at the right-hand side of the machine



Part sectional plan of the Douglas engine, showing the overhead valves and wide big end bearings which have double rows of rollers.

able. We refer to the method of fixing the engine and gear box. The power unit rests on the two longitudinal frame members which are bridged by two pieces of steel welded on the under side of the tubes. In each of these bridges there are two slots through which pass bolts from the base of the engine. By these means the engine may be slid to a limited extent in order to adjust the primary drive.

The gear box is supported from a similar bridge, but is not movable, the rear chain adjustment being effected by push screws. Among the many details of the specifications are 650×65 mm. tyres on interchangeable wheels, and a novel type of front wheel brake, which takes the form of a steel disc with an inverted V periphery upon which works a double-faced shoe.

This brake is very powerful, but sweet in action, and remains undisturbed when the wheel is removed. The rear brake is of the internal expanding type, and, with the transmission, is also undisturbed by the removal of the wheel.

One other little point will appeal to the rider. The guard over the primary drive chain is secured by spring clips, and so may be removed without the use of tools.

Low Riding Position.

Incidentally, the height of the machine is 1½in. lower than any previous Douglas model, and, when stripped for a speed competition, it weighs but a little over 200 lb.

Altogether, we were most favourably impressed by this latest product of the Bristol firm, not only as a speed machine, but a sporting tourist's mount, and we heartily congratulate those responsible for its design and production.

In addition to the new sports model "3½," the popular 2¾ h.p. solo and 4 h.p. sidecar machines will be included in the Douglas 1921 range.

Wooler Improvements for 1921.

Engine Details, Adjustable Handle-bar, New Speedometer Position.

THE 2¾ h.p. Wooler has acquitted itself very creditable this year, both in local club events and at Brooklands, the long-distance records broken recently by Macnab testifying to its staying powers. It is a most interesting little mount, and fitted with a flat twin engine of 65 × 60 mm. (345 c.c.). It possesses many novel features, including a spring frame, which make it a very suitable mount for solo work.

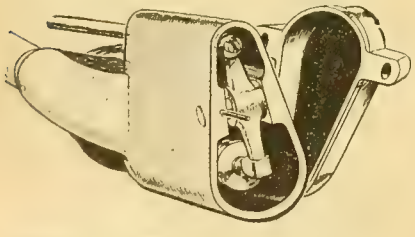
Among the chief innovations for next year is a new inlet dome, which is now held by two long studs taking the pressure of the whole casting.

The new toolbags are fastened to the carrier stays by means of six bolts, which screw into the threaded lugs on the stays so that there are externally no visible means of support.

The speedometer is carried on the near side front fork member, has a short cable, and the spur wheel is held on a bracket which moves with the front wheel spring plate. The position of the speedometer has been so arranged that a glimmer of light proceeding from the ventilating holes underneath the lamp impinges on the speedometer dial.

The crank case is now die cast, and the same method is applied to the casting of the footboards, with the result that these are extremely neat. The whole machine has been most carefully thought out, the detail work is excellent, and the manufacturing methods are all that can be desired.

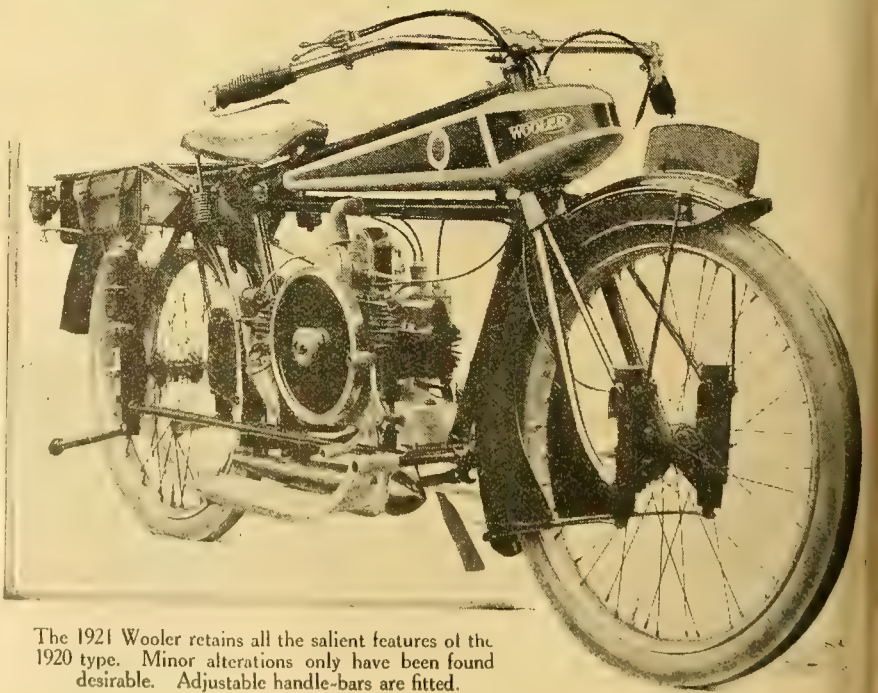
The manufacturers are the Wooler Engineering Co., Ltd., Alperton, London.



One of the new features on the 2¾ h.p. Wooler engine—the new inlet valve dome.

It may be remembered that the Wooler engine has a timed crank case release through the magneto wheel leading into the [illegible] frame tube, and finally running [illegible] the centre of saddle tube. The oil [illegible] into a ½in. pipe running down the centre of the saddle tube, in which it condenses gradually, filling up the tube with oil. A small pipe is now fitted, which drains this oil back into the crank chamber, consequently considerable economy in lubricant is effected.

Everything possible has been done to render the design as simple as possible, and practically only two size of nuts are used.



The 1921 Wooler retains all the salient features of the 1920 type. Minor alterations only have been found desirable. Adjustable handle-bars are fitted.

Twenty-three Important Records Go.

The 2¾ h.p. A.J.S. exceeds 80 m.p.h. on Brooklands. Norton secures Further Long Distance Records.

A SERIES of wonderful records were put up in the early part of last week, H. R. Davies, riding a single cylinder 2¾ h.p. A.J.S. (74 mm. × 81 mm., 349 c.c.), gaining several class B and class F records at extraordinary speeds. His time for the flying five miles, with sidecar, was 5m. 11⅘s., a speed of 57.77 m.p.h., beating S. L. Bailey's 1914 long standing class F record. He also succeeded in beating the class F ten mile standing start record, time 10m. 52⅘s., 55.18 m.p.h., the previous best again being Bailey's Douglas times in 1914. Davies's flying kilo and mile records follow in tabular form, making a total of fourteen records.

CLASS B.—SOLO MOTOR CYCLES (350 c.c.).

	Time.		Speed.
Flying kilom.	27.87 sec.	..	80.47 m.p.h.
Flying mile	47.4 sec.	..	75.95 m.p.h.

PREVIOUS BEST PERFORMANCES.—Flying kilom.: J. Dance (Sunbeam), 29.8 sec. (75.07 m.p.h.; flying mile: S. L. Bailey (Douglas), 51.4 sec. (70.04 m.p.h.).

AVERAGE MEAN SPEED RECORD.

Flying kilom.	29.9 sec.	..	77.40 m.p.h.
Flying mile	49.1 sec.	..	73.32 m.p.h.

CLASSES F. G. AND H.—WITH SIDECAR (350 c.c., 500 c.c., AND 750 c.c.).

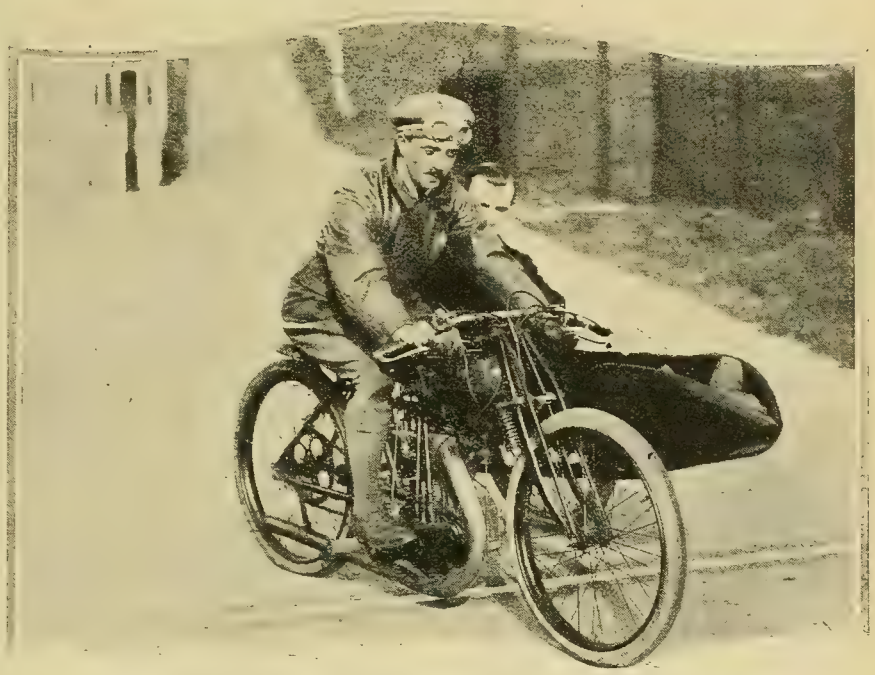
Flying kilom.	33.2 sec.	..	67.38 m.p.h.
Flying mile	55.2 sec.	..	65.22 m.p.h.

PREVIOUS BEST PERFORMANCES.—Class F.: Flying kilom., S. L. Bailey (Douglas), 42.2 sec. (53.01 m.p.h.); and flying mile, 1 min. 8.2 sec. (52.79 m.p.h.). Classes G. and H.: Flying kilom., D. R. O'Donovan (Norton), 34.6 sec. (64.65 m.p.h.), and flying mile, 58 sec. (62.07 m.p.h.).

AVERAGE MEAN SPEED RECORD.

Flying kilom.	35.6 sec.	..	62.84 m.p.h.
Flying mile	59.7 sec.	..	60.30 m.p.h.

D. R. O'Donovan (Norton) starting off after filling up with petrol during his twelve hour record-breaking ride.



H. R. Davies, who, on a 2¾ h.p. overhead valve A.J.S., broke records last week.

Equipment of the Record-breaker.

The equipment of his machine was as follows: Avon tyres, Empire de Luxe saddle, Watsonian sidecar, Thomson-Bennett magneto, Amac carburetter, Hans Renold chain, K.L.G. plugs, Shell spirit, and Castrol oil.

Proving Staying Power again.

On the same day D. R. O'Donovan, on a 3½ h.p. Norton, carried off no less than nine records in classes C, D, and E. His equipment consisted of Dunlop tyres, C.A.V. magneto, Binks carburetter, John Bull belt, Forward fastener, Speedwell oil, Pratt's spirit, and K.L.G. plugs.

The following table gives his times and the previous best performances:

CLASSES C, D AND E (500 c.c., 750 c.c., AND 1,000 c.c.).

				Speed.
8 hours	442 ml.	716 yd.	..	55.30 m.p.h.
9 hours	494 ml.	820 yd.	..	54.93 m.p.h.
10 hours	545 ml.	1,286 yd.	..	54.57 m.p.h.
11 hours	598 ml.	679 yd.	..	54.40 m.p.h.
12 hours	651 ml.	842 yd.	..	54.27 m.p.h.
450 miles	8h. 15m.	23⅘s.	..	54.50 m.p.h.
500 miles	9h. 5m.	38⅘s.	..	54.98 m.p.h.
550 miles	10h. 4m.	20⅘s.	..	54.61 m.p.h.
600 miles	11h. 58m.	22⅘s.	..	54.27 m.p.h.

PREVIOUS BEST PERFORMANCES.—Classes C, D, and E: 8 hours, C. G. Pullin and T. E. Greene (Rudge), 419 ml. 823 yd. (52.42 m.p.h.); 9 hours, J. S. Holroyd (Blackburne), 451 ml. 1,207 yd. (50.17 m.p.h.); 10 hours, J. S. Holroyd (Blackburne), 504 ml. 133 yd. (50.40 m.p.h.); 11 hours, J. S. Holroyd (Blackburne), 551 ml. 96 yd. (50.09 m.p.h.); 12 hours, J. S. Holroyd (Blackburne), 602 ml. 658 yd. (50.19 m.p.h.); 450 miles, J. S. Holroyd (Blackburne), 8h. 58m. 9s. (50.17 m.p.h.); 500 miles, J. S. Holroyd (Blackburne), 9h. 55m. 18.2s. (50.39 m.p.h.); 600 miles, J. S. Holroyd (Blackburne). 11h. 57m. 11.8s. (50.19 m.p.h.).

HIGH SPEEDS ON PEBBLECOMBE.

Ealing and District M.C.C. Hill-climb.

PERFECT weather conditions prevailed last Saturday for the Ealing and District M.C.C. hill-climb, which was well supported by members. The hill was Pebblecombe, which has an excellent surface, allowing high speeds to be attained safely. The gradient at the steepest part is between 1 in 5 or 6.

A class introduced at the last moment for all comers resulted in some of the fastest ascents, those outstanding being Capt. Frazer Nash on "Kim II." (23⅖s.), who was 1s. faster than before, his cornering and pull-up at the top being most spectacular. C. F. Temple (3½ Norton), in 26s., was the fastest motor cycle, being over 1s. faster than the next man, H. S. Keogh (7-9 Harley-Davidson), 27⅕s.

J. A. Masters (7-9 Harley-Davidson sc.), 27⅘s., made a very fast climb, being only ⅗s. slower than Keogh.

The results on time follow:

350 c.c. CLASS.—1, S. E. Longman (2¾ Wooler); 2, H. Hyem (2¾ Douglas); 3, F. A. Longman (2¾ Wooler).

500 c.c. CLASS.—1, R. M. Knowles (3½ Norton); 2, A. Giladjiam (3½ Norton); 3, P. Cunningham (3½ P. and M.).

750 c.c. CLASS.—1, R. M. Knowles (3½ Norton,; 2, R. Dequin (6 Zenith) and A. Giladjiam (3½ Norton) tied.

1,000 c.c. CLASS.—1, C. F. Temple (3½ Norton); 2, R. M. Knowles (3½ Norton); 3, H. S. Keogh (7-9 Harley-Davidson).

1,000 c.c. SIDECAR CLASS.—1, J. A. Masters (7-9 Harley-Davidson sc.); 2, R. Dequin (7-9 Harley-Davidson sc.).

CYCLE CAR CLASS.—1, W. D. Hawkes (G.N.); 2, Frazer Nash (G.N.).

The Whole Art of Watersplashing.

Four Watersplashes, each taken Twice, on Coventry Club's Closing Run.

UNFORTUNATELY, within its immediate vicinity, Coventry has not a single gradient which would trouble the most indifferently tuned solo machine.

As a consequence, therefore, the Coventry and Warwickshire M.C. cannot count upon hill-climbing failures as an eliminating factor in the process of finding a winner in its trials.

During the closing run, which took place on Saturday afternoon, the forty odd starters found that, despite the mild and sunny atmospheric conditions, their troubles were destined to be watery ones.

Scarcely had the engines time to get warm when a turn off the main road down a narrow lane brought the riders headlong into six or eight inches of water.

Of those who took the water there were one or two who entered it too fast and had anxious moments, as their expressions of pained surprise indicated, but, nevertheless, they recovered in time to change down and make a safe crossing; in this category were the Rev. J. M. Philpott (2¾ Wilkin) and E. Marshall (4¼ Humber), but C. Massey (2¾ Hoskison) was unable to change into low before his engine stopped.

How it is Done.

Some of the riders, especially the sidecar men, adopted weird attitudes in the endeavour to protect their lower limbs from a wetting, but none of the soloists attempted to ride with their feet upon the tank. One or two, however, found a lodgment for their toes on the front down tube of the frame, and so kept their boots above water. Perhaps the most spectacular showing, however, was that of S. R. Philpot, who gripped the tank of his 2¾ h.p. Douglas high up with his knees, and spread out his feet in the air well above the spray, steering a perfectly steady course withal. The same cannot be said of all.

The trial savoured more of an aquatic carnival than a reliability test, since the riders took to the water eight times. E. Marshall (4¼ Humber) negotiating the stream at Canley.

Four watersplashes were included in the Coventry and Warwickshire M.C. Trial last Saturday, and these had to be taken twice on the circuit. The illustration depicts E. Astley (5-6 Rover sc.) negotiating the Kenilworth ford

Another smaller splash was crossed, then a splendid main road run to Kenilworth followed, where the ford near the Castle was crossed (by those whose luck held out!). Only a dozen yards at most, and barely 6in. deep, this obstacle caused innumerable failures.

Few got over under power, suffering either from "shorted" sparking plugs or from excess of back pressure owing to the exhaust pipe being submerged. One rider, W. G. Blatch (7 Rudge sc.), made provision against wetting his feet by having a length of rope secured to the front forks. The moment his belt commenced to slip his passenger hurled the end of the rope to land and spectators towed the outfit across with its engine still running.

After this point some twelve miles of narrow lanes, very greasy in places and containing another brook to cross, brought the competitors, sadly thinned in numbers, to the starting point for a second circuit of the same course. Here some of those who had a clean sheet previously found that their luck had deserted them, while others, profiting by previous experience, went warily, and survived for the final section—a main road to Coleshill, where the eighteen finishers took tea.

The results were:

CLASS 1 (SOLO MOTOR CYCLES).—E. A. Barnett (3½ Invicta). Time error, 3m. 36s.

CLASS 2 (SIDECAR MACHINES).—E. Astley (5-6 Rover sc.). Time error, 8m. 10s.

Their awards were a rose-bowl and a cup respectively, presented by the Cycle and Motor Cycle Manufacturers' and Traders' Union.

Dispensing with the Carbide Container.

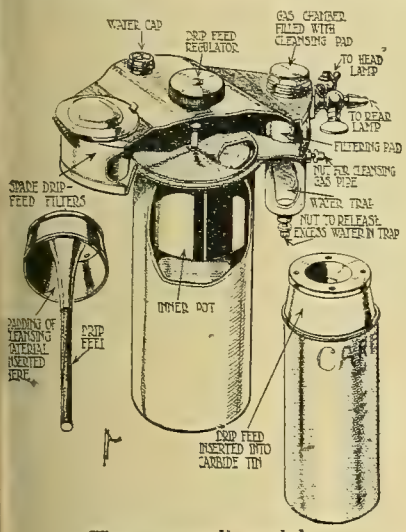
A Novel Acetylene Gas Generator in which the Carbide Tin is utilised.

MOST motor cyclists have at times grumbled about the inconsiderate behaviour and "messiness" of the average acetylene gas generator. Probably, there are few acetylene lighting installations which do not, at some time, prove themselves unreliable after neglect on the part of the owner.

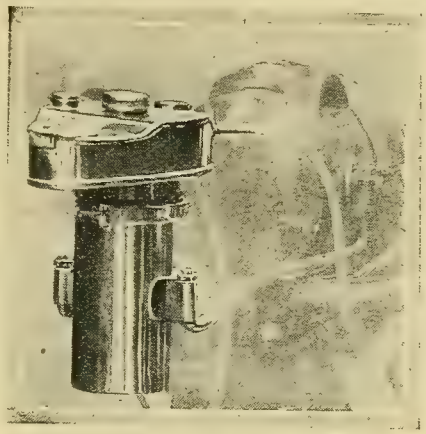
We illustrate here a very novel type of generator which has been designed by Mr. Hawley Morgan, who, it will be remembered, produced a forced draught cooling system some time ago. The object of the design has been to remove all the undesirable features which tend to make the refilling of the generator a very messy procedure. As a motor cyclist, the inventor has, regardless of conventional design, produced this device essentially for the motor cyclist.

The principal feature is the use of the actual tin in which the carbide is purchased, and, when expended, the old tin may be thrown away and a new one rapidly replaced. The unpleasant business of cleaning the carbide container is therefore avoided. Provision has been made so that half and one pound tins may be utilised.

So far as the water system is concerned, it follows general practice. The water container is located at the top, and only its oval streamline shape is somewhat unconventional. At the edge of the water container is a small cylinder containing a number of spare *papier mâché* filters, and at the front is another cylinder, partly filled with cotton wool, through which the gas passes before its exit through the two taps screwed to the outside of the container.



The generator dismantled.



Showing the "carbide tin" container in use on the Hawley Morgan generator.

A compensating device is incorporated in the drip feed, which is controlled by a brass milled head, and the usual needle valve fits into a tapered hole drilled in the base of the container.

Clean and Rapid Refilling.

Brazed beneath the water container is a brass cylinder, inside which is housed a shorter cylinder, provided to accommodate the carbide tin. In the top of this is the aperture through which the water drips. In order to secure a gastight joint, a rubber washer is fixed round the feed pipe, and is shaped to coincide with the tapered recess in the cap placed over the carbide tin.

The water is conducted first to the bottom of the carbide by a central tube drilled and covered with lamp wick. When one charge of carbide is expended, the *papier mâché* filter, placed on top of the carbide, is renewed and the cap replaced over another tin. Since these are the only operations required to refill the generator, it is obviously a clean and exceptionally rapid procedure.

The lower half of the generator, shown in the second drawing, accommodates the top cylinder and carbide tin, which compresses a coil spring located in the bottom half of the generator, and is, therefore, immune from rattle. A rubber washer is housed in an annular slot cut round the top of the lower half of the container, and is contracted round the top half by means of a floating ring and segment clamp closed by a bolt and butterfly nut. This telescopic arrangement permits the accommodation of a half or a one pound tin of carbide.

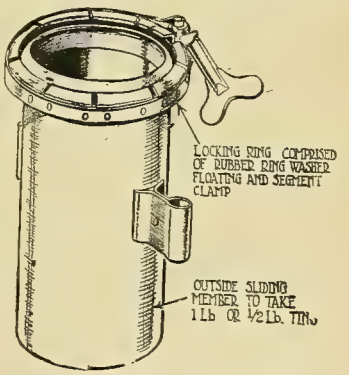
So far as the functioning of this device is concerned, it has throughout the extensive tests that we have given it generated consistently, and it will not, though the water regulator is turned fully on, generate sufficient excess of gas to create a flare at the burners.

Lengthy Burning Capacity.

The act of changing the carbide tin is a real pleasure after the messy business common to most carbide containers.

The burning capacity is sufficient to light a head and tail lamp for three hours on a half-pound charge, and for six hours on a pound tin.

Another feature that calls for comment is the brilliantly white and unflickering light produced over the worst of roads.



Showing how the lower half of the generator accommodates the carbide tin.

NUMBER PLATES FOR THREE-WHEEL CYCLE CARS.

AS our readers will be aware, there are two legal sizes of number plates: the large size for vehicles above a ertain minimum weight, and the smaller or motor cycles and runabouts below hat minimum. The deciding factor in hichever size number plate is to be used the weight of the car, tricycle, or otor cycle concerned.

Taking the case of the three-wheel nabout, which, in the eyes of the law, regarded as a motor tricycle, many wners have thought that, because they ay only £1 per year tax on the motor cle basis, they are at liberty, therefore, use the smaller size number plate as ed on motor cycles for that reason. This is perfectly correct so long as the weight of the runabout does not exceed 3 cwt. In the event, however, of the vehicle exceeding that weight, *it must by law be fitted with the full size number plates*, and, incidentally, be registered as a car at £1 instead of a fee at 5s. where the weight is below 3 cwt.

Although only taxed on a motor cycle basis, a good many Morgan Runabouts are above 3 cwt. in weight, and should, therefore, be fitted with the larger number plates on which the size of the letters and figures must be 3½in. high and 2½in. wide (except the figure "1"), and each part of the letter or figure must be ⅝in. broad. The space between adjoining letters and figures must be ½in., and the margin from the nearest part of any letter or figure and top or bottom edges of the plate is to be ½in., and at the sides of the plate at least 1in. Where a square, instead of an oblong, plate is used with the letters above the figures, the space between the row of letters and figures must be ⅜in.

In the case of motor cycle type number-plates, the dimensions as given may be halved, and the shape of the plate need not be rectangular so long as the minimum margin between any letter or figure and the top, bottom, and sides of the plate is preserved.

CLUB NEWS. (Continued from page 503.)

Marlow and District M.C.C.

A visit was paid by the club to Hampton Court on the 24th inst., and an enjoyable afternoon was spent. It is hoped to carry on the club through the winter.

Mansfield and District M.C. and L.C.C.

This club is holding speed trials at Clipstone Drive on Saturday, October 30th, starting at 1.30 p.m. The event is open to all residential members of the club, and so far fifty entries have been received.

North London M.C.C.

The Dukes Salon at the Holborn Restaurant was the scene of a brilliant and successful function on Saturday last when the North London Motor Cycling Club held its first annual dinner. Toward the close of an impromptu musical programme the various cups and awards won by members during the season were presented by the president, Mr. Kennedy Jones, M.P., who, in a few well-chosen words, congratulated the club on its marked success during the first season, and expressed his intention of presenting a trophy for competition next season. Short secretarial and financial reports were given by Mr. B. Staley and Mr. G. W. Townsend respectively, the former receiving quite an ovation in virtue of his being the founder of the club. The hearty and repeated singing of "Auld Lang Syne" brought a most successful function to a close, and there is every prospect of a largely increased membership next year. A full list of officers and particulars of winter social events will be published shortly.

Ilkley M.C. and L.C.C

A motor cycle trial on particularly interesting lines was held on October 17th for a trophy presented by two of the vice-presidents, Messrs. W. Moore and W. Mangham. It took the form of a despatch rider's trial, and, whilst the competitors responded well to the test in time and reliability riding, there was quite a number who proved to be weak in map-reading ability. Apart from the announcement that arrangements had been made to serve lunch at Burnsall the route was secret, but the committee, evidently with their minds upon previous events this year over the Yorkshire Dales, were good enough to announce that the ninety-mile route would not include any watersplashes or freak hills. As each competitor started from headquarters he was handed a card marked with a destination a town or village clearly marked on Ordnance Survey Map No. 9. The card also gave the distance by the nearest route. Upon arrival he was given another card, with another destination, the being repeated until he arrived back at headquarters. Twelve controls were arranged in Wharfedale and Airedale and with thirty one miles [illegible] interesting trial was [illegible] The [illegible] were as follows: J. Moore and Mangham Trophy and gold medal, H. O. Wood (3), Scott, no error 9m. 5s. 2 silver medals, W. Bradley (7) Indian, error 19m. 2s. 3 bronze medals, H. Pendle (6), B.S.A., error 17m. 55s.

N.M.C.F.U. (Coventry).

The following are the final placings in the trial for the Martin Cup, held on October 17th. The event was decided on total time variations from schedule, as many gained 100% marks: 1, Winner of Martin Cup, T. Mallalieu (4 Triumph sc.); 2, S. Healy (4 Triumph sc.); 3, A. Vice (4 Triumph sc.); 4, R. P. Vann (4 Triumph sc.).

Stevenage and North Herts M.C. and L.C.C

The results of the club's reliability trial, in which thirty competitors started, are now to hand:

CLASS 1 (Under 350 c.c.)—Gold medal, R. Shelford (2¾ Coulson-B); silver medal, S. W. Watson (2¾ Douglas).

CLASS 2 (Over 350 c.c.)—Gold medal, W. Fitch (4 Triumph); silver medal, O. D. Hall (3½ Ariel).

CLASS 3 (Passenger).—Gold medal, J. Gibson (10 Morgan); silver medal, C. Bourlet (3½ Ariel sc.); bronze medal, R. Madgin (3½ P. and M. sc.)

The club is shortly holding a hill-climb and autumn dinner, and is arranging a series of concerts during the winter for its members. The hon. secretary, A. Egan, will be pleased to hear of any motor cyclists in the district who are interested.

North Lindsey A.C.

A well-attended hill-climb was held on West Halton Hill on October 16th. The results are as follows:

CLASS 1 (350 c.c. Two-strokes).—1, Nurse Clarke (2¼ Levis).

CLASS 2 (350 c.c.).—1, J. Clark (2¾ Douglas), fig. merit 1,632; 2, F. G. Howard (2¾ Invicta), 1,688.

CLASS 3 (570 c.c.).—1, F. M. Long (3 A.B.C.), fig. merit 860; 2 B. York (3½ Norton), 1,000.

CLASS 4 (570 c.c. to 1,000 c.c.).—1, F. G Howard (8 Zenith), fig. merit 1,207; 2, H. Jarvis (6 Bat), 1,215; 3, H. Nelson (5 Zenith), 1,353.

CLASS 5 (570 c.c.), on time.—1, B. York (3½ Norton), 26s.

CLASS 6 (Unlimited), on time.—1, F. G. Howard (8 Zenith), 23s.; 2, H. Jarvis (6 Bat), 26s.; 3, F. M. Long (3 A.B.C.), and B. York (3½ Norton), 27s.

CLASS 7 (Passenger machines above 350 c.c.).—1, J. Clark (5 Rudge sc.), fig. merit 1,502; 2, F. G. Howard (8 Zenith sc.), 1,622.

The fastest time of the day was made by F. G. Howard (8 Zenith), 23s.

Loughborough and District M.C.C.

There was a very large entry for the petrol consumption trial arranged by the above club on the 24th inst. The formula used was one supplied by the A.C.U., but it was found that the heavier machines had undue advantage, and on their allowance travelled two or three times as far as the lightweights. A quantity of petrol, varying according to formula, was measured out in cubic centimetres at the start of the thirty miles run to Alvaston, and the three machines which travelled furthest were proclaimed winners. Some had sufficient to take them over the course and to Leicester and back—an additional eighteen miles—whilst the winning three went even further on the allowance which was calculated to carry them thirty miles. The winner was A. J. Foster, whose consumption worked out at 81.4 m.p.g. on a 6 h.p. A.J.S. sc., fitted with Binks carburetter. Next came F. Craner (4 Rex sc.), with 90 m.p.g.; third, E. Oliver (10 Morgan), who carried three passengers, and had a figure of 55 m.p.g. The best solo performance was made by Harold Petty (3½ Norton), who did nearly 150 m.p.g., and B. Greaves (3½ Rover), 130 m.p.g.

N.M.C.F.U. (Barrow and District).

The annual general meeting and dinner took place on Thursday, October 14th, at the Imperial Hotel, Barrow. There was a good muster of members and friends, and the prizes won during the past season were presented.

An attractive programme is being arranged for next year, and intending members should communicate with the hon. secretary, W. A. Singleton, 144, Sutherland Street, Barrow.

Proposed Yorkshire Centre A.C.U.

A meeting has been arranged for the purpose of forming a Yorkshire centre of the A.C.U. Representatives from all motor cycle and light car clubs in Yorkshire are invited to attend the above meeting, which will be held at the Griffin Hotel, Boar Lane, Leeds, on Saturday, October 30th. It is essential that representatives of all clubs be present, in order that a centre be duly formed and receive the assent of the A.C.U. prior to the annual meeting at Olympia during the Motor Show.

Surbiton and District M.C.C

The Ballard's Cup Trial for motor cycles and cycle cars will be held on Saturday next, the 30th, starting at 10 a.m., from the Talbot Hotel, Ripley. The course will be about one hundred miles in length, and will include the principal hills in Surrey. The chief awards will be the Ballard's Cup, value 25 guineas, presented by Messrs. Ballard's Motors, to be held for one year, together with a gold medal, for the best non-stop performance of any machine; the special Zenith gold medal, presented by Zenith Motors Ltd., for the second best non-stop performance; the Haslam prize, presented by the Rev. W. Haslam, for the best performance of a lightweight under 350 c.c.

Brighton and Hove M.C.C.

At a recent hill-climb of the above club some excellent sport was witnessed by large crowds. The hill was black with spectators; and a fairly easy gradient and a good surface allowed some very fast times to be put up by the competitors. In the 350 c.c. class Moreton, on a 2¾ Douglas, made a fine climb, being 4⅕s. faster than the next man. The 600 c.c. class resolved itself into a duel between the A.B.C.'s and Nortons, Volk (3 A.B.C.) eventually proving the winner after a dead heat. The Nortons, however, made fastest time of the day, and won the unlimited solo class. J. Chater Lea (8 Chater Lea sc.) simply soared up the hill in the unlimited sidecar class, his Brooklands racer making the excellent time of 29s. The light car class was won by Welford on a G. P. Morgan. The times were as follows:

350 c.c. CLASS.—1, H. W. Moreton (2¾ Douglas), 26⅘s.; 2, D. Longstaff (2¾ Douglas) 30⅘s.

600 c.c. CLASS.—1, C. Volk (3 A.B.C.), 24⅘s. 2, D. Carden (3½ Norton), 25s.

UNLIMITED CLASS.—1, D. Carden (3½ Norton), 23s.; 2, C. Volk (3 A.B.C.), 24⅘s.

UNLIMITED SIDECAR CLASS.—1, J. Chater Lea (8 Chater-Lea sc.), 29s.; 2, C. Farley (4 B.S.A. sc.), 51⅘s.

LIGHT CAR CLASS.—1, W. Welford (G P Morgan) 37s.; 2, H. Hawkins (10 G.N.), 40⅘s.

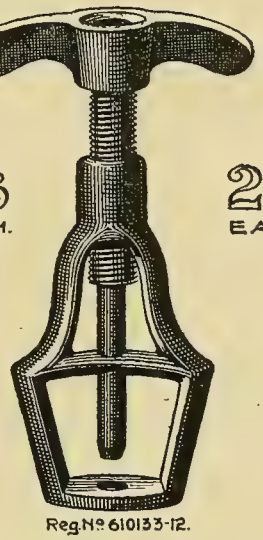
SPHINX
BELT PUNCHES
Universally used



2/6 EACH. 2/6 EACH.

Reg. No. 610133-12.

Made for ¾" ⅞" 1" & 1⅛" Belts.

SPHINX Belt Punches are distinguished by several exclusive features. In order that there may be no possible chance of the punches breaking away, and also to ensure that they shall be exactly concentric, they are formed from the same piece of steel as the screws. Apart from the merit of the design, this construction gives maximum strength. Note also the guide which makes it impossible to cut a hole in the belt except through the exact centre.

Obtainable from all Agents of repute or direct from the Manufacturers at the following prices—

Single Model (as illustrated) 2/6
Duplex Model (for ⅞in. and 1in. Belts) .. 4/6

Something like a Testimonial for "SPEEDWELL" OIL

S. M. ADAMS,
Motor Agent,
BELFAST,
writes 2/9/20:—

On Saturday last at Magilligan Strand, I got first in the 350 c.c. 5 mile Scratch Race on a 2¾ Verus Machine. This was my first experience on "SPEEDWELL" Motor Cycle Oil, and the result in using your Oil proved conclusively that ONE CANNOT SAY TOO MUCH FOR IT.

In my opinion it is a SUPERIOR OIL TO ANY I HAVE USED IN MY SIX YEARS' EXPERIENCE OF RACING. Needless to say in all forthcoming events I shall run on nothing else.

"SPEEDWELL" OILS
are stocked at all leading Garages.

WORKS LIGHTING

By D. H. Ogley, B.Eng.

With a Preface by Prof. E. W. Marchant, D.Sc.

THE importance of good lighting in the factory and workshop is now fully recognised. In this book all kinds of illuminants—gas, electricity, and oil—are fully dealt with, their efficiency as light producers discussed, and their application to modern works' conditions described and illustrated. A chapter is also included dealing with natural lighting.

The whole subject is treated very exhaustively, with the view to assisting manufacturers to select the best means of lighting for any given purpose.

Price 7/6 Net. By Post 7/10.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements the mention of the district in which the machine offered may be seen and tried.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally generous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the fact as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

DAVIS'

Ustikon

PATENT

SOLES & HEELS

have effectively demonstrated the uniform high quality to many who have now become "second-nature" users.

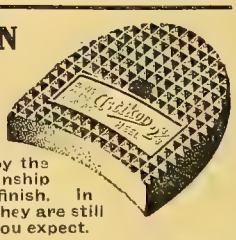
Their refinements and durability will be considerably gratifying to you.

No apparatus is necessary, nails or screws are obviated and, moreover, you get a sole that is absolutely waterproof. Surely Ustikon Soles are worth consideration.

GENTS', all sizes 3/9
LADIES', all sizes.. .. 2/9

Complete with Sol-fix and directions.

USTIKON HEELS



The wearing quality of these Heels is indicated by the fine workmanship and careful finish. In actual wear they are still better than you expect.

What is a Lightweight?

THE line of demarcation between the lightweight and the heavier types of motor cycles has always been a matter of opinion. Hitherto, engine size has been the deciding point, and generally about 350 c.c. capacity has been regarded as the limit of the lightweight.

Although engine capacity has some bearing upon type, it cannot be said to be an essential factor, as a machine weighing 190 lb. may have an engine of 1,000 c.c., while the engine of another weighing 300 lb. may be only 350 c.c.; yet, according to past and present ideas of lightweights, the heavier machine would be a lightweight and the lighter one would not.

Just as weight should be the deciding factor with a light car, so should it be with the light motor cycle, and as, next year, taxation will automatically divide motor cycles into two classes, the line made by the Government, at the suggestion of our governing bodies, should be used to determine the limits of a lightweight.

If this ruling for taxation be accepted by the trade and riders as showing the line of demarcation, then only those machines which weigh under 200 lb. should be termed lightweights, irrespective of their engine capacity.

At the present time there is no authentic list of weights in existence, as our efforts to obtain correct figures have been confined to those machines we have weighed ourselves. Hitherto makers have quoted only approximate weights, but the new taxation should induce catalogue compilers to be accurate on this point, as, in cases where a machine is on the border line, it will make a difference of thirty shillings in taxation.

We urge all makers to quote in their lists the exact weights of their machines. Catalogues are being prepared at the present time, and we would suggest that it would give would-be purchasers confidence in the figures given if an actual weighbridge ticket were reproduced.

Police Permits for Exports?

UPON transport in its various forms depends the welfare of the nation, and the question of its cost has a great influence upon the cost of living. One would think, therefore, that the Ministry of Transport would be too occupied at the present time to be concerned in matters which seem to be designed for no other purpose than to hamper industry.

We refer to certain proposals which we understand are being considered by the Ministry, one of which, if carried into effect, must have a retarding influence upon the Overseas trade of the motor industry. True, it is only a rumour—but rumours of which we take notice may be accepted as being more than idle gossip. The suggestion, we understand, is that the Ministry of Transport proposes to seek compulsory powers to ensure that police permits be obtained before any motor vehicle is shipped abroad.

This new form of red tape is intended to be added to the mass of formalities which are a source of discouragement to manufacturers who endeavour to improve our foreign exchange by developing trade abroad. It is well known that for years *The Motor Cycle* has continuously used its influence to foster overseas trade, and we are in a position to state that in many quarters export trade is not considered worth the trouble entailed in getting the goods out of the country. The necessity for permits is bound further to restrict business with Overseas markets, and on this score alone the proposal should be dropped.

The idea of imposing a restriction of this character is to prevent traffic in stolen machines—truly an extraordinary remedy for a doubtful disease—and would be a measure stigmatising every exporter as a wrongdoer upon whom a check should be kept. It is not in keeping with the traditions of a country where everyone is deemed innocent until proved guilty. We hope to hear no more of this absurd barrier to the success of British trade Overseas.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Trials for Man or Machine?

OUR article of October 21st under the above heading put the case extraordinarily well. (N.B.—*I* didn't write it.) Veterans will remember that pushbicycle competitions went through three stages.

Stage 1.—Competitions tested the bicycles, advertised the makers, and provided sport for riders.

Stage 2.—Competitions advertised the makers and provided sport for the riders.

Stage 3.—Competitions provided sport for the riders.

I have long ceased to take a cycling journal, but I imagine that stage 3 still persists, and that the North Road C.C. and other clubs still organise competitions, in which only a very small and very enthusiastic minority of push-cyclists are seriously interested. Ultimately motor cycle trials will reach the same phase. At present we are still in stage 1. I agree with the writer of our article that the A.C.U. Six Days exist to inform the general public about the capacity of current machines; and I see no reason why the one-day trials should not be encouraged to provide all possible sport for us maniacs who support them. It is sad to think that a day must come when the man who tries to win medals on a motor cycle will be regarded with the same genial contempt by the general public as the people who lie awake at nights scheming how to put an extra mm. on to the bore of a prize leek.

Route-marking in Trials.

I AM sure that on consideration, the Rev. J. M. Philpott will agree that yellow ochre ought only to be used for route-marking in conjunction with arrows. I have ridden through several trials this year in which road-staining was the sole directive at many points. It is well enough on a lonesome Scottish moor, where there is no traffic about, but is altogether too distracting when there is a lot of traffic, or pedestrians about. But if you are entering the main street of a busy townlet by a narrow lane, and leaving the street on the other side by another narrow lane within a few yards, especially when the lanes are massed like the spokes round a hub, you cannot afford to glue your eyes on a graceful blue or yellow stripe on the cobbles. Some riders, no doubt, are blessed with a natural squint. Personally, on these occasions I value an obtrusive little placard; and, as other correspondents point out, it is the easiest job in the world to devise a placard which is not at the mercy of small boys. Placards used discreetly in conjunction with road-staining provide an ideal system. Is this correspondent so innocent as never to have noticed that certain trials organisers have a penchant for placing their arrows when they cannot easily be seen? In the 1919 Arbuthno Trophy (which was a non-stop), many arrows wer ingeniously posted so that the riders ran special risk of overshooting them and missing a turn.

A Low Saddle.

NOT infrequently a tall rider finds it difficult t wangle quite the ideal riding position. He can not get far enough back on the frame, becaus the average saddle has a bridge piece at the back which fouls the carrier tie-bars or even the rear guard For such cases I can recommend the B220 Brook saddle, which has no rear bridge piece. There ma be others, but up to date it is quite the lowest saddl I have struck.

The Magdyno.

DOUBTING Thomases, who wonder whether Magdyno will serve them as faithfully as ou untidy but loyal friend acetylene, should pluc up heart of grace. This system of electrical lightin has now been adopted on a cheap but sound make c car, to wit, the 1920 Morris-Cowley. More than tha the Morris-Cowley has been selected by the She interests for the transport of their battalion of travelle —if you see a Morris-Cowley painted Post Office re you behold a Shell testimonial to the reliability of th Magdyno. This augurs well for the future of electr lighting on motor bicycles. I am having one fitted t a baby two-stroke for winter pottering.

Road Signals and Motor Cyclists.

I HAVE not forgotten the newspaper boys who use to dodge their 2 h.p. Minervas through Londo traffic in all weathers with a hundredweight parc of the *Star* on their backs. But the ordinary rider less agile, and I should say the most obvious poi about compulsory road signals is that when the roa are greasy not one rider out of every two dare take hand off his bar to signal. This difficulty does n apply in all localities, for some roads are never real slippery, and it is true that when London wood pavi is greasy, the duffer type of solo rider makes a poi of staying indoors. But nevertheless there are tho sands of riders who often find themselves in the sad under conditions where they would rather risk a pros cution than steer one-handed, even for half a secon I ride generally in all weathers, but I am not asham to confess that there are certain traffic centres a certain corners where I need both hands if the surfa is greasy. Let Sir Eric Geddes do a month on a hea twin solo this winter before he enforces these sign on us. Why, there are times when I wait a mile or to inject a pump of oil because I dare not let go.

Gaiters Justified.

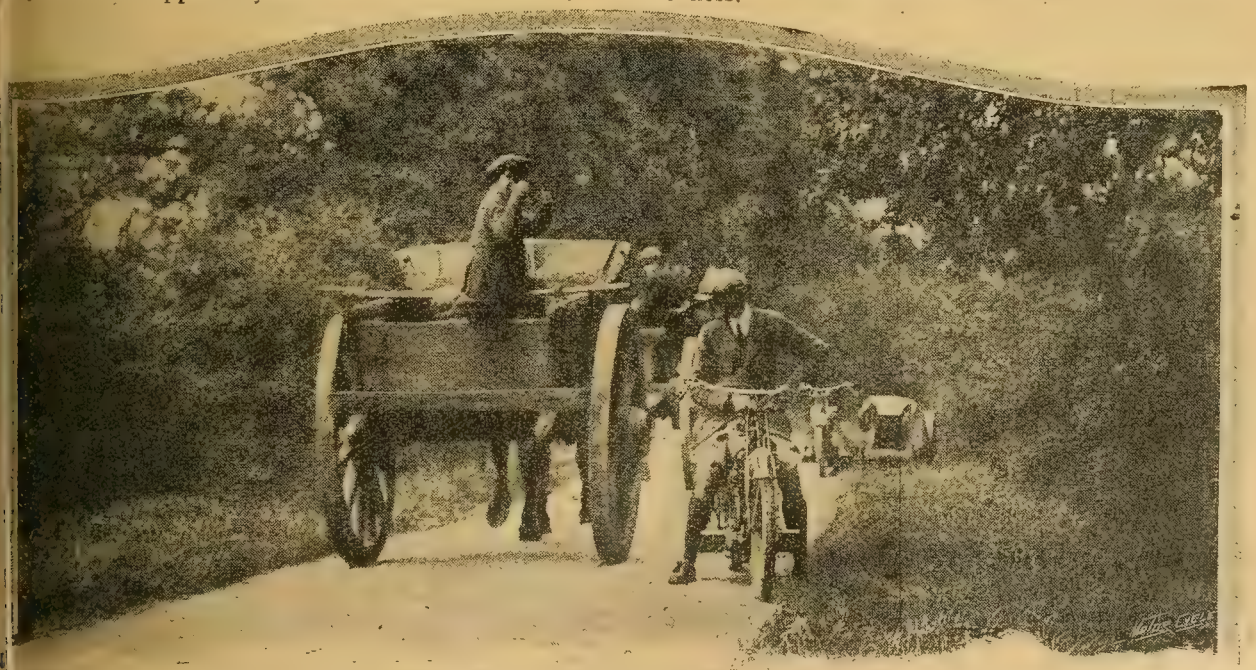
DINING out the other night, I experienced sensations analogous to those of speed wobble when I found myself placed next a gaitered prelate by a tactless hostess. I say tactless, because motor cyclists are fundamentally godless, since our hobby turns us all into pessimistic materialists, whereas a bishop is—or should be—an optimistic spiritualist. Anyhow, whilst I desperately rummaged my memory for fragments of the thirty-nine articles, the jovial bishop opened the ball by remarking that he rode a Baby Triumph. This put me at my ease, and when he mentioned that his diocese was in Central Africa, I foresaw copy, and began to neglect my soup. The next bombshell was that he infinitely preferred a push-cycle. This was simply shocking! I reversed our respective *rôles*, and called up all my reinforcements with the intention of making a convert. Let me confess at once that I failed.

A Novel Market.

THE right reverend gentleman explained that he had bought a Baby Triumph because he often tackled 300-mile jaunts through bad lion country, and that a lightweight was essential, as a river ford often ended in a vertical bank twenty feet high, up which one might have to hew steps. On the other hand, the best machine had its drawbacks, for there were no garages or hotels in the bush. One has to carry weapons, tent, fuel, oil, and food, as well as the special episcopal impedimenta (he did not specify what these were, but unless the Ingoldsby Legends are out of date, let us put it at bell, book, and candle). A sidecar or cycle car was impossible, owing to the narrowness of the track. He had tried trading on native carriers to establish dumps at native huts and villages, but this system was not satisfactory, as the native huts are infected with "tick fever," which is apparently first cousin to trench fever, and quite incurable. So this peculiar branch of the Overseas market demands a bantamweight machine, capable of transporting, say, a couple of cwt. of luggage, and absolutely proof against serious breakdowns. I was unable to recommend an ideal mount for such conditions, and I did not blame his lordship in reserving his Baby Triumph for use on the one good road in his outlandish diocese. My natural shyness prevented me from suggesting that he was sure to win a gold medal if he entered in the Six Days.

Drying Up.

I PUBLISH the following experience without prejudice, as nothing in my own Odyssey forms a parallel to it. A Midland doctor, who is something of a motor cycling "knut" to all appearances, tells me that he has two sparking plugs which I know to be first-rate—in fact, I often use sister plugs on any engine which is apt to dry up. He finds that if he hill-climbs at maximum speed on an A.B.C. or a Scott, the machines will do about three ascents of his pet test hill in great form; *e.g.*, at 60 m.p.h. more or less. If he continues to make fast ascents the engine "dries up" and stops. I cannot make head or tail of this. My own experience with "drying up" is that a very brief stop puts things right, and I have never owned a mount which could do three fast climbs in succession, and would then dry up on a fourth, after the long cool implied in a descent of the hill. If the version of the facts is correct, I should say that the sparking plugs are only the secondary cause. The primary cause must surely be metallic distortion in the engines of an unusually slow and progressive character. I should judge that in the case of the A.B.C. the piston rings are probably on the tight side, and that the drying up would disappear with wear; and that in the case of the Scott the walls of the cylinder may possibly vary a trifle in thickness.



"Thumbs up." Although only the joke of a youngster with a sense of humour, the action could be taken as symbolic of the motor cycle movement. In spite of the turmoil through which industry is now passing, it is at heart sound, and things are in reality "All right."

DAY TRIPS and WEEK ENDS

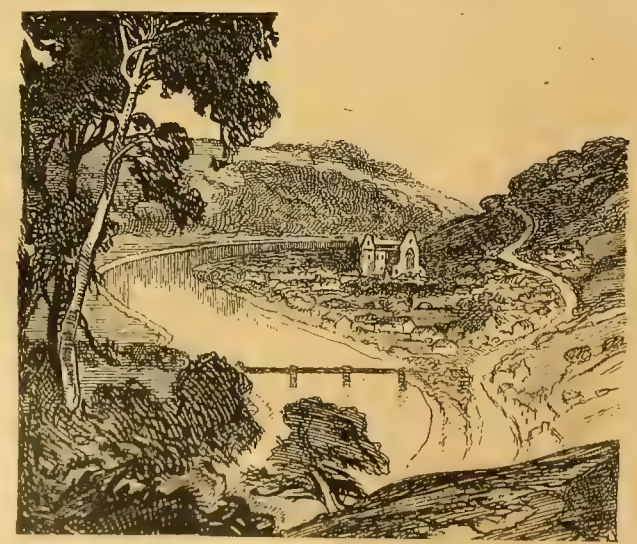
by C.G. HARPER

CHEPSTOW TO ROSS, HEREFORD, AND ABERGAVENNY.

THIS is a route of magnificent scenery and roads chiefly of great excellence: a wonderful combination greatly to be desired and not often experienced. Chepstow stands beside the river Wye, where it broadens out, presently to meet the Severn. Here is the lowest bridge over the Wye, and from the other side of it (not on our route to Monmouth, but worth crossing for the view) is the best idea of Chepstow's situation to be obtained. There you see that Chepstow, before ever it became a market town, was a place of great military importance. Cresting the limestone cliffs rising from the river runs the long length of the ruined castle whose last fight was in 1648. By a picturesque stroke of poetic justice, the regicide, Henry Marten, was at the Restoration imprisoned in one of the ruined towers, and there he died in 1680. But we need not pity him, for that "imprisonment" was an easy one, and he visited and dined out with the Welsh squires at neighbouring Piercefield pretty much as he pleased. His epitaph, of his own composing, may be read in the grim Norman church of Chepstow. It is worth reading; the beginning of it is after this manner:

"Here or elsewhere, all's one to you, to me,
Earth, air, or water gripes my ghostless dust;
No one knows how soon to be by fire set free.
Reader, if you an oft-tryed rule will trust,
You'll gladly do and suffer what you must."

Chepstow Castle, a stronghold of olden days.



Tintern Abbey is one of the most beautiful and familiar sights of the Wye Valley.

Describing the Valle of the Wye and Son of its Beauty Spo

We leave a commonpla road behind at St. Arvan in two miles, and en upon a delightful thr miles to Tintern, with t Wye looping upon its below, on the right, a the wooded hills and cli of the Wyndcliff on t left. The Wye so co pletely doubles upon own course that it fon almost an island. It is t peninsula of Llancau with a ruined chapel on The grey ruins of Tinte Abbey presently sho ghostlike, among the app orchards beneath the roa Descending into the villag past the "Beaufort Arms the west front immediate faces the street. Tinte was a monastery of the white monks, the Cistercian who settled here in 1131. This religious house w founded by Walter de Clare, who thus sought, li many of the pious founders of that age, to compou for his deeds of violence. Rebuilt in 1260, the rui stand as an example of th purest phase of Ear English. There was nev any tower. Merely roofles the Abbey is not a ru in the complete sense, a could be restored, if suc a doing were thinkabl Some twenty years ago was purchased by th Government from the Duk of Beaufort, and is in th keeping of the Woods an Forests Department. It well seen from the wate side, but best from the hil sides above Little Tintern whence you look down upo the river, the valley, an the road, and can take i the whole situation.

Under Barbador Hil but along an easy road, w proceed by Llandoge

A picturesque spot near Abergavenny on the Monmouth road.

Court, and were built by Sir Samuel Meyrick, a famous antiquary in his day, a hundred years ago.

In a further three miles we cross the ancient bridge at Wilton, with its pillar sun dial, and come uphill into Ross, famous for John Kyrle, the bachelor benefactor of this, his adopted town, born 1637, died 1724. The house he lived in faces the quaint old Market House. He looked from his windows upon the Market House day by day, and, being an ardent Royalist, he caused to be carved on those old walls a curious device yet to be seen there, formed by the letters "F" and "C" impaling a heart, and signifying "Faithful to Charles in Heart." Such were the simple conceits of bygone ages. The many things that John Kyrle, the "Man of Ross," did for Ross cannot be detailed here. He caused the lofty church spire to be rebuilt; and, being a lover of trees, he planted, among others, the churchyard avenue of elms. It was, therefore, with something like superstitious awe that the people of Ross, a good many years ago, when one of the elms he had planted was cut down, saw two elm-suckers springing up in the church through the floor of his pew. And there they are, to this day.

The Fair City of Hereford

The way to Hereford is unmistakable. At three and a half miles out, keeping to the left at the fork, and thence through the hamlet of Old Gore, it becomes very hilly. Passing Fownhope, the road touches the Wye, and comes to Mordiford, where, turning left, we cross the river and come into the fair city of Hereford on the level.

Hereford is a cheerful and bustling city, very busy in the agricultural way, especially in cattle, and very much more modern in general than would be expected. But the cathedral, in its quiet Close, sounds a vastly different note. A small but beautiful and stately cathedral, of a red sandstone, with architecture ranging from grim and heavy Norman to the last phase of Gothic.

Day Trips and Week Ends.—

The most curious thing in it is a map of the world, made in 1314: a fearful and wonderful, if at the same time, an extraordinarily incomplete world. Hereford, be it said, is one of those trebly-blest cities that have no tramways.

It is from across the Wye that, looking back, we get the best view of Hereford. Here we turn south, and at the fork roads in half a mile bear right, for the twenty-three miles to Abergavenny—a very pleasant road, past Tram Inn railway station, St. Devereux, Wormbridge, and Kenderchurch. The tourist who cares to turn threequarters of a mile left at St. Devereux will be repaid by a sight of Kilpeck Church, one of the smallest, and one of the most perfectly beautiful of late Norman churches, in this country. Beyond Kenderchurch we enter at Pontrilas the valleys of the Dore and Monnow. Thence by Pandy, where the road grows hilly, to Llanvihangel Crucorney. The park here is notable for its fine avenue of Scotch firs, the noblest in the county. Finally, past Mardy, comes Abergavenny, busy and prosperous, with its battered old Priory Church and collection of much mutilated effigies, suffering from the surgical operations and amputations inflicted in the past by fanatics or by the merely mischievous. And that is what the power and state of the ancient Lords Marchers, th fierce de Braoses and others, have come to: an arra of broken-nosed, and some armless and legless effigies

Abergavenny sits on the hillside above the meetin of the rivers Usk and Gavenny, in a pleasing lan commanded by that great hill, or mountain, the Sugar loaf, nearly four miles distant, but looking nearer from its abrupt outline. It rises to 1,954 feet.

The remaining seventeen miles into Monmouth ar part of the great main road from Gloucester to Milfor Haven. It is an easy road, beginning along the valle of the Usk, passing Penpergwm and Rhyd-y-Grave Here, at the fork roads, keep to the left, avoiding th right-hand turn for Usk. Soon we come to Ragla Village, with the massive and stately ruins of the castl on the left: that fortress residence of the old Marqu of Worcester, who, at the age of eighty-four, defende it in the interests of the Royalists in the long sieg of 1646, and finally surrendered only to starvatio marching out with all the honours of war, as so gallan a gentleman should. Through Mitchell Troy villag and then past the park of Troy House, until recen years a seat of the Duke of Beaufort, we short come into Monmouth across the ancient Monno Bridge, and under the archway of its defensible gat

The distance covered on this route is 81½ miles.

PETROL LEVEL.

Methods of effecting an Essential Carburetter Adjustment.

WHEN making experimental adjustments to cars or motor cycles, it is always advisable to be able to return at once and with certainty to the original state of things in case the alteration made turns out to be a disadvantage rather than an improvement. This applies with especial force to the setting of the petrol level in the float chamber of a carburetter. The advice usually given is to move the collar up or down the needle as required by means of a vice and a hammer. This is all very well in some cases, and it is not difficult to tap the needle farther through the collar when the petrol level is to be lowered by holding the needle loosely in the vice with the collar resting on top or at the side of the jaws and tapping the reverse end gently with a small hammer. The collar is generally a driving fit, in which case no difficulty is likely to be experienced, but sometimes it is sweated on, and then heat must be applied. It is not so easy to move the collar in the other direction because the point of the needle cannot be tapped without risk of damage. The procedure will then be to hold the needle tightly in the vice and slip over its point a piece of tube which is loose on the needle but will engage the shoulder of the collar, and tap this with the hammer. In the event of a suitable piece of tube not being available (a very likely contingency), an adjustable spanner can be made to take its place. These operations are shown in the accompanying sketches. When the collar is shifted on the need it is not easy to return it exactly to its original po tion if the alteration proves to be the reverse of ben ficial—moreover, some carburetter needles have, i stead of a movable collar, a small slot into which t clip can spring. Therefore it is better, at any ra until the experiments have proved their success, to alter the level by means of washers—a light washer below the clip will lower the level and a heavy one above the clip will raise it. As some floats have a very small margin of buoyancy, the washer washers, used below the clip, must be very light or th will not have the desired effect. A cork washer will satisfactory where petrol only is used, but this wo be destroyed by benzole and become crumbly. small aluminium washer will serve the purpose adm ably, and is easily made from sheet aluminium if a is available, but this is not always the case. T small brass eyelets used in boots and shoes, and obta able at a few pence per dozen from a shoemaker cobbler, will prove very suitable. The wide e should be placed on the float, and the narrow e which can easily be cut with a pair of scissors if it too high, against the clip, or, in a top feed carburett against the collar.

AURIGA.

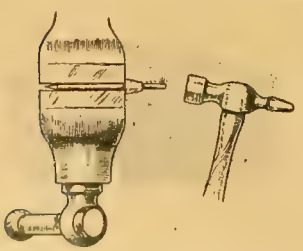

Fig. 1.—Moving the collar of a carburetter needle away from the point. The needle is held loosely in the vice.

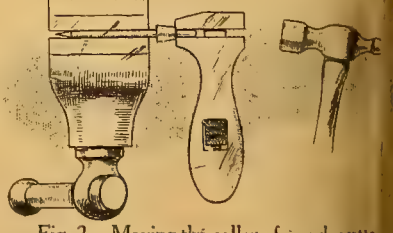

Fig. 2.—Moving the collar of a carburette needle towards the point. In this case th vice grips the needle tightly and the spanne is free to slide.

Testing a Chassis-less Sidecar.

The Advantages of Non-rigid Structures as applied to the Sidecar Strikingly Demonstrated

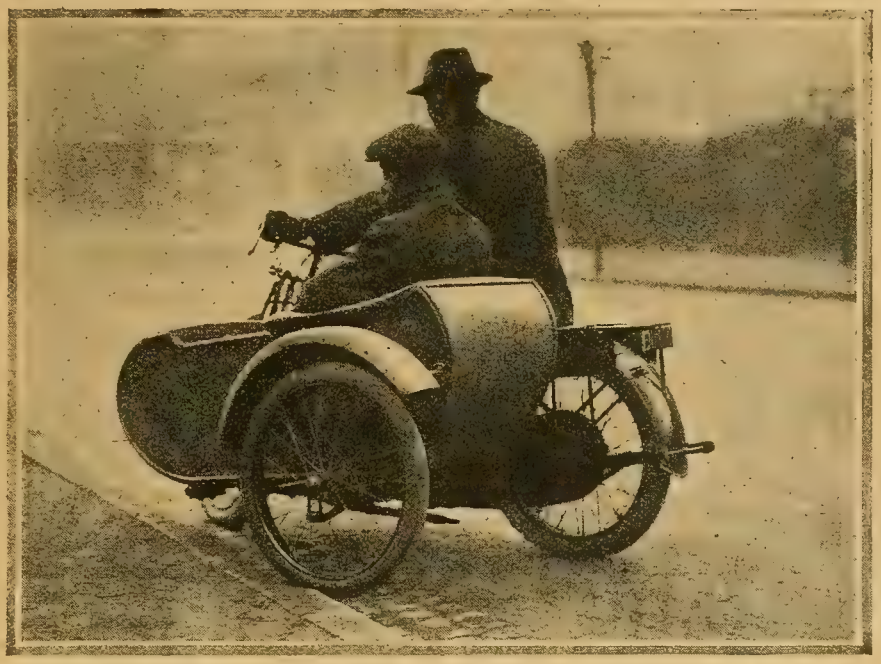
A NEW sidecar, to be known as the Millford-Rock, manufactured by Messrs. Mills-Fulford, Ltd., of oney Stanton Road, Coventry, is to be own at Olympia, and it is one well rthy of inspection.

The design has already been described our pages (issue of August 5th, 1920). may be recalled that it is of Aus- lian origin, and no doubt its production some reflex of the road conditions in t country. As far as Great Britain concerned, it will be associated with old-established name of Millford, and ore deciding upon its adoption as a ndard 1921 model the makers have put hrough some most searching tests.

Charging Kerbstones.

t a later date we shall describe the hod of construction, but the model we ected and tested was not exactly as final product will be issued, for eral of the experimental fittings were d-made. The sidecar is unique in t it has no chassis, but consists simply double cranked axle, flexibly attached the chain stays of the cycle at one and carrying the wheel at the other. lerneath the body are bearings in ch the axle swings, and an adjustable ng transferring the load on to the iked arms of the axle. The bottom the body, of course, is specially gthened, and is held at the front telescopic spring connection, while a lar arrangement connects the axle to seat lug of the machine, thus keeping latter vertical.

he whole structure is quite flexible, no matter how the wheel strikes acles, the sidecar body floats on, or less undisturbed; it is quite ible to swerve into the kerb of the path with the side wheel at 15 or 18 m.p.h., and only cause the slightest shock to the sidecar passenger. Over a deeply pot-holed road merely the minimum of vibration is felt—not nearly so much as that experienced in a large and well-sprung car when passing over a similar place. Steering is also improved, especially as regards left-hand turns, which may be made without the least fear of the sidecar lifting. None of the connections being rigid, the severe side thrusts and jolts to which the motor cycle frame is usually subjected are almost entirely damped out.



Trying to break the new Millford-Rock sidecar. Attached to a 6 h.p. A.J.S., this chassis-less spring sidecar has been taken at high speeds over all the worst roads in the Midlands; charging into kerbstones without warning is its daily gruelling, but although the passenger may be startled, he scarcely feels the bump!

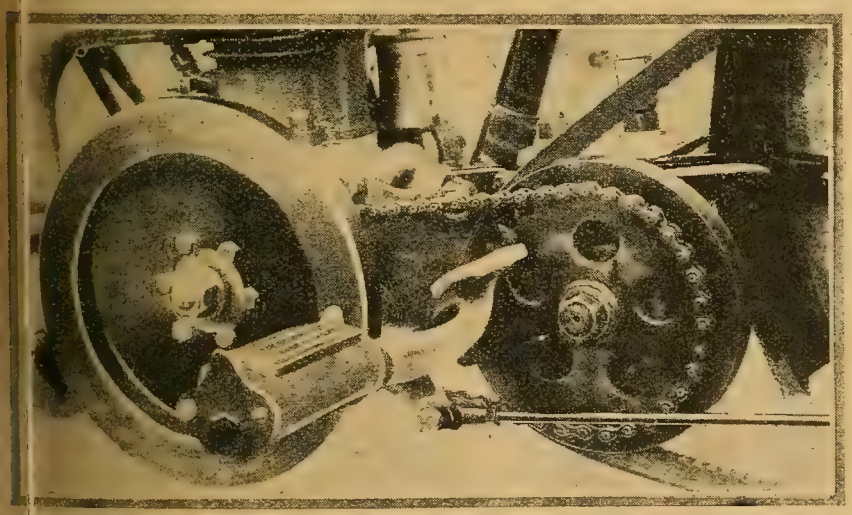
Fitting a Countershaft Gear.

Gear Boxes for Well-known Single-geared Lightweight.

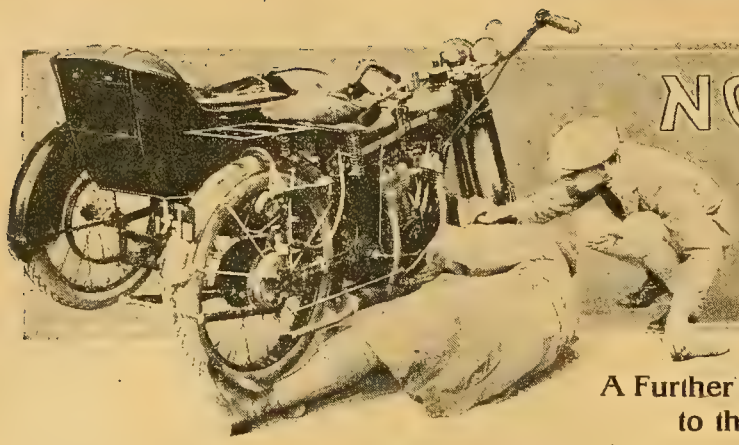
MOST people who own single speed motor cycles desire sooner or later to convert them so as to take a gear box. The 1920 O.K. Junior motor cycles have all been made with single speeds, and owing to the construction of the bottom bracket it has been rather difficult to have a countershaft gear box fitted.

The Albion Engineering Co., Ltd., Tower Works, Upper Highgate Street, Birmingham, by a slight alteration of their gear box, and by making a special set of holding-on bridges, are now able to get over this difficulty, and fit the simple two-speed and the clutch and kick-starter gear boxes without alterations to the frame.

If the engine fitted is the Union or Mark II. Villiers the flywheel must be sent to the Albion Engineering Co. to be bored out, and have a special adapter made for the sprocket, but for the Mark III. or Mark IV. Villiers engines sprocket adapters can be supplied.



An Albion two-speed gear fitted to an O.K. Junior. Any model of this single-geared mount may now be so converted.

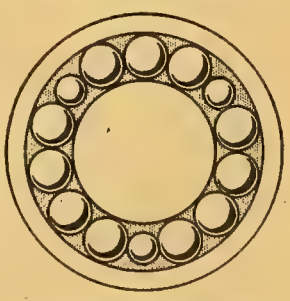


NOTES FOR THE NOVICE VII

A Further Series of Hints, with Special Reference to the Adjustment of Cycle Bearings.

(*Continued from page* 434.)

AS motor cycles were evolved from pedal cycles by the addition of engines, etc., it is not surprising to find that they bristle with cycle parts. Some motor cycles seem, indeed, to have been evolved rather than designed, and this, no doubt, accounts for the great popularity of the diamond frame (so-called), which has made good, and proved its suitability for cycles, where the propelling power is provided by the rider, but cannot be considered ideal in all points when the propulsion is provided by an engine. Some points of similarity between the pedal cycle and the motor cycle have disappeared, or are in process of disappearing—for example, the change-speed gears in the rear hub, brakes on the wheel rims, and small, unpadded saddles. This is all to the general good, and there are other features which might well follow their example. The design and method of adjustment of the steering head cannot be considered ideal. Thrust bearings are usually employed, and these are not suitable for the more severe strains which would be better resisted by journal bearings. What is wanted is the combination of thrust and journal bearings found in the corresponding parts of a car, or, failing this, the cup and cone adjustable bearings found in cycle wheels would be an improvement, as these are capable of resisting both transverse and longitudinal strains.



Occasional small balls, which do no harm, but help to keep the other balls in their places.

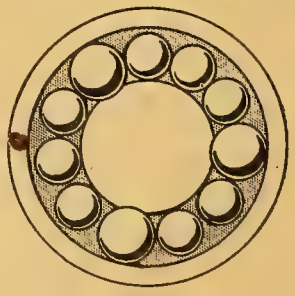
The Advantages of Correct Adjustment.

In the days of the cycle boom cyclists took a great pride in their machines, and spent much time in keeping their bearings clean, and in correct adjustment, for carelessness in these matters meant that the rider had to work harder when propelling his machine along the road, and found a difficulty in keeping up with his companions. Correct adjustment has the further great advantage that it improves the wearing qualities of the parts, and the rider will have no need to complain to the maker that the machine has failed to give the length of service which might have been expected.

The average motor cyclist, too, takes a considerable amount of trouble in looking after his machine, but he is often apt to forget that the whole cycle needs attention, and to confine his efforts to his engine and to playing about with his carburetter—a fascinating pursuit, it is true, but not all that requires doing. The wheel bearings should be carefully adjusted so that the side shake is *just* removed, and the wheels left perfectly free on their bearings. The final test for freedom should be made after the lock nuts have been tightened up, for sometimes screwing these up has the effect of tightening the bearings more than is intended.

Replacing Balls.

If, by any chance, it becomes necessary to replace any of the balls in a bearing it is essential that they shall be of identical size with the old ones, otherwise they will not do their proper share in carrying the weight. In the event of being unable to obtain balls of the correct size, one or two balls smaller than the fellows will function satisfactorily, especially if the small balls are placed at intervals; but occasional large balls are very harmful, and should on no account be used, as they may give way themselves under the extra load they have to sustain, or damage the cups and cones. It is generally the last-named that suffer first, and correct adjustment becomes a length impossible.



Occasional large balls, whose presence is very deleterious, and which will soon ruin a bearing.

Locknuts.

Many motor cycles are provided with locknuts for the bearings inside the forks instead of relying upon the nuts which hold the wheel in place to do a double duty as on pedal cycles. This is fairly common on rear wheels (but sometimes also applied to the front), and is good in itself because it enables a wheel to be removed for tyre changing purposes without interfering with the adjustment of the bearings; and also because it provides an interval between the fork and the bearing which gives the mud which runs down the fork better opportunity of dropping off before it can reach

otes for the Novice.—

ie bearing—in my opinion a very important point, nd one which more makers would do well to con-der, especially on their front wheels.

Head Adjustment.

There is, of course, far less movement in the bear-gs of the head, which oscillates slowly or remains actically stationary while the wheels are revolving pidly, than in the other bearings, but it is just as portant to keep these bearings properly adjusted. ther a loose or a tight head has a very bad ect upon the steering.

It is fairly common practice to drive the magneto a chain, although a gear drive is generally recom-nded by the magneto makers. Unless this chain very carefully adjusted it will, on the one hand, im-se undue strains upon the bearings of the armature being too tight, or, on the other, become loose ough to hit against its cover and cause a most oying rattle. The difficulty is often increased by the use of sprockets having a small number of teeth. The chains employed generally are half-inch pitch, and I should be inclined to advise the use of a chain of shorter pitch, as this innovation would admit of sprockets having a greater number of teeth without any increase in the overall diameter, resulting in a smoother running chain. Another reason why the correct adjustment of the magneto chain is so important lies in the fact that a slack chain causes the magneto timing to be somewhat retarded, although the ignition lever may be in the position of full advance. This is liable to cause the engine to overheat, and, in general, to have an adverse effect upon the running.

BRAKES AND SKIDDING.

An Account of Experiments with Models which seem to Favour the Front Wheel Brake.

THE front brake of a motor cycle is usually regarded as an unnecessary encumbrance, fitted only to comply with the law. Even the careful r rarely thinks of using his front brake, and rds it only as an emergency fitting.

he neglect of the front brake is due possibly in a e measure to the idea that its use is liable to e skidding. It is true that on a push bicycle the len locking of the front wheel down a steep hill is able to project the rider over the handle-bars, but following considerations will show that a front el brake properly used is far preferable to one he rear wheel.

s far back as 1904 the effect of brakes on the on of a car was discussed by the eminent tist, Sir George Darwin, at a meeting of the British ciation in Cambridge. Without going into his ematical treatment of the problem, it is well while repeating the experiments he performed, h show in a most striking fashion the effects of ying the brakes to a car.

e apparatus required is of the simplest character, the experiments can be performed in a few ents by anyone. All that is required is a small n wheels—such as the truck of a toy train—and ping board down which the car can travel.

xperiments duplicating Road Conditions.

the experiments performed by Sir George Darwin brake" was applied by locking one pair of the ls before letting the car slide down the board. st, the rear wheels were fixed and the car allowed de. One would expect the car to take a straight down the slope, the locked wheels acting as a behind. Actually what invariably happens is the car turns completely round, and finishes its ey with the locked wheels in front. If the model s started with the front wheels "locked," it s a perfectly straight descent.

these experiments the car was started with the s on. By a slight modification, the conditions can be made more nearly to approach to those on the road. A short piece of thread is fixed at one end to one of the axles, and at the other to the body of the car. As the car rolls down the slope, all four wheels revolve, and the thread is rolled round the axle until it is taut. In this way the brake is applied suddenly to one pair of wheels, and the result can be studied.

An Anti-skidding Rule.

If the front wheels are braked, the car suddenly slows up and finishes in a straight course without skidding. If the rear wheels are suddenly locked, the car skids. If the board is sufficiently wide, the model will swerve to one side, turn completely round, and finish its course with locked front wheels.

From these experiments it would seem that the proper course is to apply brakes to the front wheels.

Other considerations, however, affect the design of motor vehicles. It requires more complex mechanism to transmit the power from a lever to the front wheels, although this was done on some of the early tricars; for example, the Humber of about 1906 had compensated band brakes working on the front wheels. Again, most riders naturally prefer to operate a brake with the foot rather than by hand; and in the case of a motor cycle it is much simpler to connect the foot lever to a rear brake than to one on the front wheel.

Closely allied to the action of brakes is the effect of the application of the driving force to a wheel.

It is well known that on greasy roads or wet tramlines any sudden torque on the back wheel of a motor cycle may have disastrous effects.

The cause is the same, viz., an effort to rotate the wheel at a speed different from its natural rolling speed on the road; it is immaterial whether it be faster or slower. Hence the rule in bad weather should be to avoid rapid acceleration and deceleration.

J. T. DUFTON, M.A.Cantab.

Road Tests of New Models

Some Road Impressions of the Dunelt 500 c.c. Two-stroke as a Sidecar Machine.

WHEN long before last Olympia, we first inspected the drawings and experimental engines of the Dunelt big single two-stroke, we felt that, with perseverance and careful study on the part of its designers, it would eventually materialise as a serious sidecar proposition.

It was exhibited at the last Show, and created a great deal of attention as a passenger machine at a popular price. The exhibit served merely to test the potential demand for such a machine, and no orders were accepted, as the makers had still certain difficulties to overcome, and to make arrangements for production.

In the meantime, encouraged by the interest manifested in its design, the experiments were continued, and two machines were entered in the A.C.U. Six Days Trial. One of these was fitted with a sidecar, and was in the hands of a driver who had never before competed in a trial.

A Wonderful Performance Recalled.

We confess that when we saw the machines at Darlington, on the eve of the start, and learned that the sidecar outfit had only a 12 to 1 ratio for its lowest gear, we thought its chances of securing a "gold" were small. It was the first time a two-stroke had taken a sidecar through a Six Days Trial—and the most difficult Six Days to boot—yet both machines secured the much prized gold medals.

This trial proved that a 500 c.c. air-cooled two-stroke was a practical proposition as a sidecar machine, and was at least the equal of a 4 h.p. of the four-stroke type. In fact, it is worthy of note that 4 h.p. four-stroke sidecar machines were originally entered, but were withdrawn when the severity of the route became known.

At Olympia this month, the Dunelt will again be exhibited, but this time as a commercial proposition.

Recently, we were afforded an opportunity of trying the sidecar outfit on the road. The machine itself being one of the Six Days mounts, with many thousands of miles to it credit. The Sturmey Archer gear box was still in the position adopted hurriedly for the big trial, that is above the bracket designed for a different type of gear box which was fitted to the machine at the last Show. In the production model the more conventional position below the bracket has been decided upon.

It may be remembered that the Dunelt differs from the orthodox three-port type of engine in one important respect. It has a stepped cylinder and piston which increases the displacement in the crank case. This provides better scavening and, in consequence, less tendency to four-stroke at low speeds and under light loads. The "two diameter" piston also has the advantage of being cooled on both sides of its wall by the entrance of the cool gases. Whether or no this is one of the reasons why the engine runs so cool the fact remains that it will apparently run indefinitely without overheating, and without giving trouble through distortion.

This is certainly an important point gained, as although the Dunelt is not the first big single air cooled two-stroke, it is the first to be placed on the market in this country, after it has been proved equal to all the tasks expected from a machine of its size.

The Effect of Appearance.

One's first impression of the Dunelt from an appearance viewpoint is the apparently enormous size of the cylinder. This is due to the double diameter piston referred to above. Then its inclined position in the frame, and the angle of the intermediate frame tube give the machine the appearance of being somewhat high at the front.

These latter points, however, are only first impressions created because the machine departs from conventional outlines. It is not, however, so heterodox as to create unfavourable comment. It is merely different, and therefore attracts the eye.

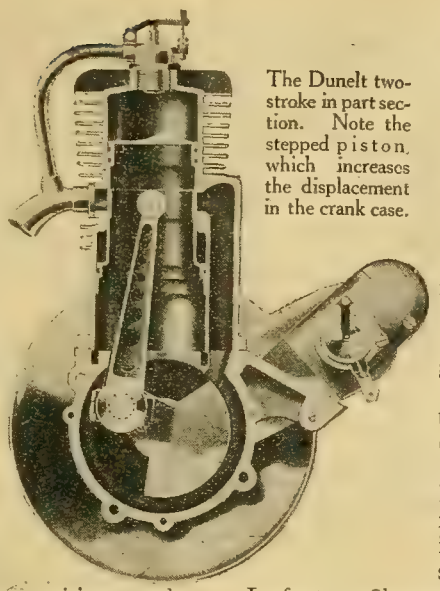
Once in the saddle, any suggestion of unconventionality disappears, and one gets an impression similar to that obtained on a big twin or 4 h.p. single with

Road Tests of New Models.—

large tanks. One has no doubt that the Dunelt is a fully-fledged sidecar machine, and when the engine is started there is little of that uncertainty of impulses usually present with a two-stroke. The machine we tried certainly four-stroked a little, but scarcely any more than some flat twins have eight-stroked; in fact, when running idly, the occasionally four-stroking reminds one of a twin of which one cylinder is occasionally cutting out.

Once under load, however, all four-stroking ceased, and, with the even torque of a flat twin—without a flat twin's mechanical sounds—the machine gets away smoothly and without any "fuss." A strange carburetter, with lever opening in the reverse direction from the one we had just left, a totally different riding position, and different location of the brakes were all points which were against favourable impressions at once, but in a hundred yards we were quite at home on the machine.

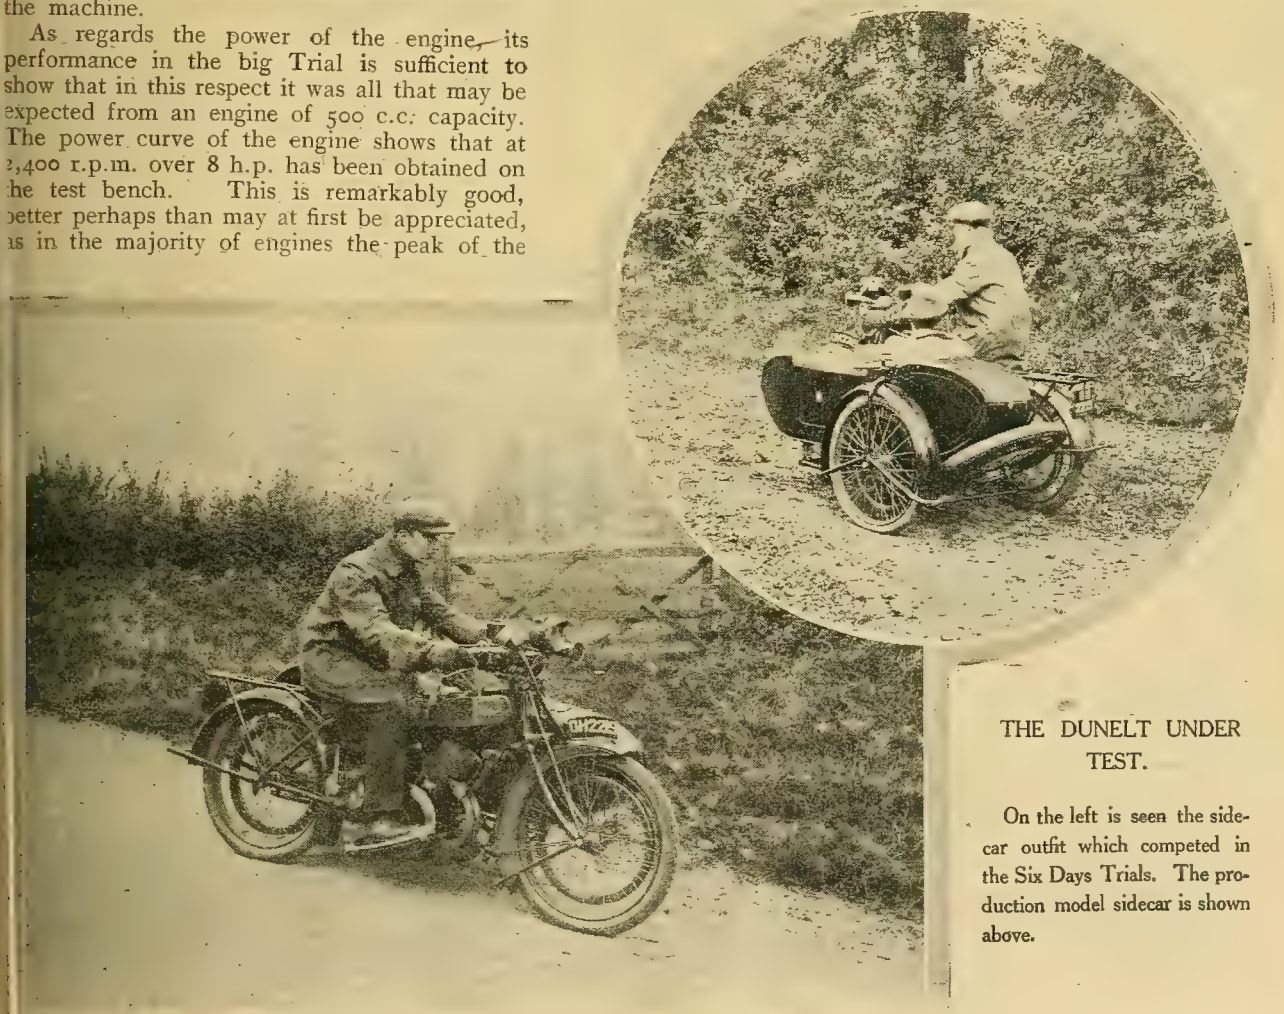
As regards the power of the engine, its performance in the big Trial is sufficient to show that in this respect it was all that may be expected from an engine of 500 c.c. capacity. The power curve of the engine shows that at 2,400 r.p.m. over 8 h.p. has been obtained on the test bench. This is remarkably good, better perhaps than may at first be appreciated, as in the majority of engines the peak of the curve is reached at higher speeds—speeds which are seldom used in a motor cycle. For a motor cycle, at all events, an engine which will give good power at the lower speeds is better than another which may develop a greater power at much higher speeds.



The Dunelt two-stroke in part section. Note the stepped piston, which increases the displacement in the crank case.

The Dunelt engine develops 5 h.p. at 1,400 r.p.m. and 6 h.p. at 1,600 r.p.m., and as these are the powers and speeds used under normal conditions, such results should be regarded as very satisfactory.

Incidentally, the average 1,000 c.c. twin at about 2,700 r.p.m. generally develops about 13 h.p. So far as retaining its power is concerned, we have seen many engines tested, and must say that the Dunelt maintained its maximum in a manner quite as satisfactory as four-stroke engines. In fact, we have been surprised at the length of time this big two-stroke has run all out under the adverse conditions existing in a shop. Probably it is owing



THE DUNELT UNDER TEST.

On the left is seen the sidecar outfit which competed in the Six Days Trials. The production model sidecar is shown above.

Road Tests of New Models.—

to the satisfactory reading at the lower end of the curve that the makers favour comparatively high gear ratios, and in riding the machine we have the impression that the top gear was a little too high for sidecar work, notwithstanding that a very satisfactory speed was obtained on the level. This, however, was only an impression, since we had just dismounted from an 8 h.p. twin, and were on a strange machine.

Probably other riders have noticed that, having become accustomed to one machine, it requires some time to be able fairly to judge the speed, power, and tune of a strange mount. Especially is this the case when one leaves a four-stroke and tries a two-stroke.

A Comparative Test.

After having again taken over our own machine, we accompanied the Dunelt exponent, Capt. Dudley Barton, who rode the solo machine in the Six Days, and who now took the Dunelt with empty sidecar, when the big two-stroke proved to be superior to the twin, which had twice the capacity.

As a solo machine, too, the Dunelt should be satisfactory; but in making it a dual purpose mount the designers appear to have considered that the larger number will be used with a sidecar. It has quick detachable wheels, interchangeable all round, including the sidecar, and we understand it will be marketed with a spare wheel, so it will be seen that it is as a sidecar outfit that the greatest demand is expected.

Smoothness and Economy.

The engine is particularly smooth in its running, for which its large outside flywheel is partly responsible, while as for flexibility, exhaust noise, and petrol consumption it compares favourably with a four-stroke of its power. With an automatic carburetter 60 m.p.g. is being obtained with sidecar and passenger, but the makers hope to improve upon this in the production model, which we hope to test more fully at a later date.

In the meantime we are very favourably impressed by the general performance of the machine, and congratulate Messrs. Dunford and Elliot upon the successful issue of their long series of experiments.

The Real Lightweight.

Will the 70 lb. Motor Cycle Materialise Next Year?

THE idea of a 70 lb. lightweight on true motor cycle lines, as distinct from the miniature developed from the scooter, is an attractive one to a large number of potential riders who require a runabout machine. Many who are in the market for such machines have stated their requirements to be a small motor cycle at the price even below that of a scooter, and opinion has been almost unanimous that it cannot be produced.

At the present time the 1¾ h.p. J.E.S. is the nearest approach to the type of machine we have in mind, but instead of being a development of the motorised bicycle, the new type will be a redesigned proposition entirely on motor cycle lines.

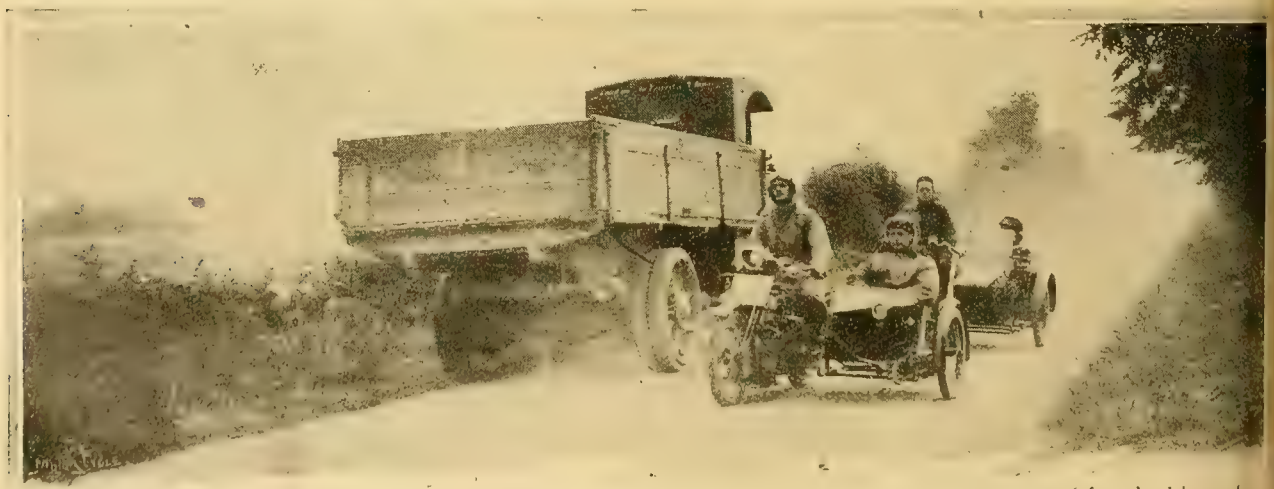
After a week-end on one of the Simplex motor attachments fitted to an ordinary pedal cycle, it occurred to the writer that, since the pedalling gear is only used for starting, it seemed quite possible that by dropping the frame to permit the rider to paddle off, the pedalling gear need not be fitted. Once started, this train of thought quickly outlined a miniature motor cycle built mainly of reinforced cycle parts, having simple spring forks and a tank in the conventional position. Had time permitted such a machine would have been built.

The power required would be about 1½ h.p., say from 150 to 175 c.c. capacity, and preferably should be of the two-stroke type and have a two-speed gear.

True, it would be an "absurd toy" to the man who uses a fully-equipped big single for runabout work, but there are thousands who require a motor cycle only to run from home to office or to the golf links, and a machine as outlined would fill the bill, giving pedal cycle service without the exertion.

Next year we may see such machines.

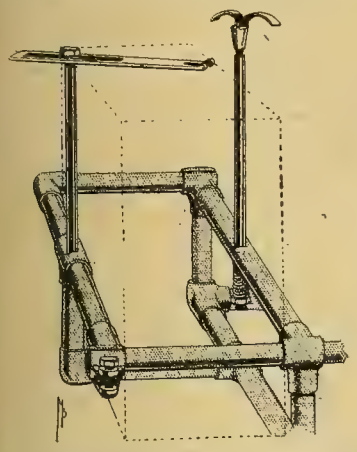
VEDETTE.



Here is a proof that all lorry drivers are not the inconsiderate individuals some people would make out. As a matter of fact, the drivers of these leviathans usually give way to passing vehicles with more grace than many car drivers we have met on the road.

DUNHILL'S SIDECARS.

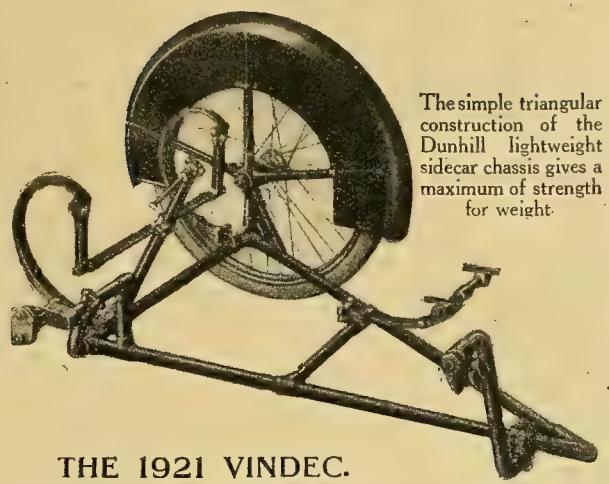
FEW firms have studied the sidecar question more intelligently than Messrs. Dunhills, Ltd., 359-361, Euston Road, London, N.W.1, and their proudest boast is that they have never had one of their sidecar chassis break. The essentials of their design are simplicity and strength. The lightweight chassis, one of the simplest forms of sidecar frame, has proved to be eminently satisfactory.



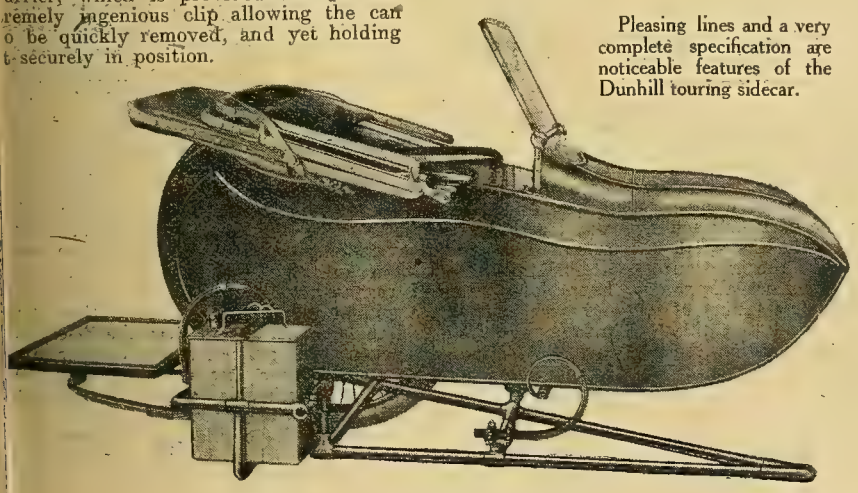
A sturdy petrol tin carrier is an integral part of the heavyweight Dunhill sidecar chassis. The fastening is quick-acting and secure.

As may be seen from the illustration, it is constructed on triangular lines which is, admittedly, the only theoretically correct method of taking stresses. Thus this chassis should give a maximum of strength for weight; and, although primarily intended for a light sporting body, comfortable springing has by no means been neglected.

The heavier touring model, suitable for attachment to powerful twin-cylinder machines, remains very much the same in design as the 1920 pattern, but it has been improved by the addition of a well-sprung luggage grid mounted on quarter-elliptic springs. The platform is 20×15in. Incorporated with the chassis, and forming an integral part of it, is a special spare petrol tin carrier, which is provided with an extremely ingenious clip allowing the can to be quickly removed, and yet holding it securely in position.



The simple triangular construction of the Dunhill lightweight sidecar chassis gives a maximum of strength for weight.



Pleasing lines and a very complete specification are noticeable features of the Dunhill touring sidecar.

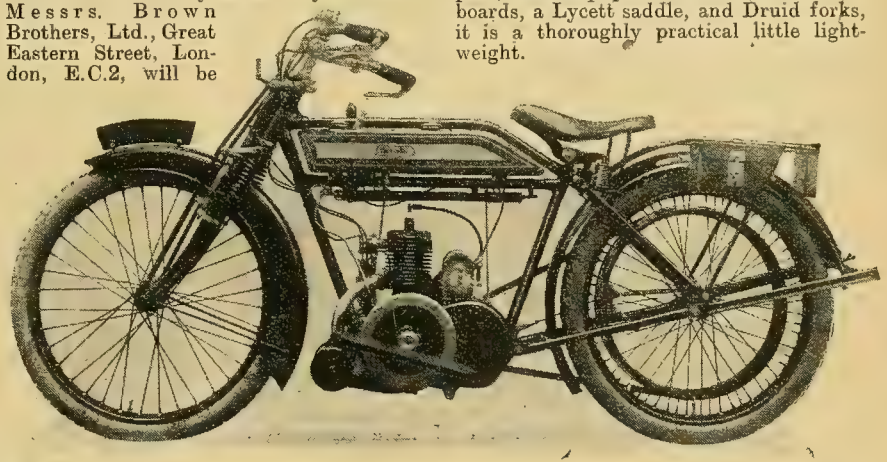
THE 1921 VINDEC.

THE 2½ h.p. two-stroke Vindec is a distinctly attractive little mount, and is the only motor bicycle which Messrs. Brown Brothers, Ltd., Great Eastern Street, London, E.C.2, will be exhibiting this year at the Olympia Show. The power unit is a two-stroke engine specially designed for this machine, and has a bore and stroke of 64×70 mm. (226 c.c.).

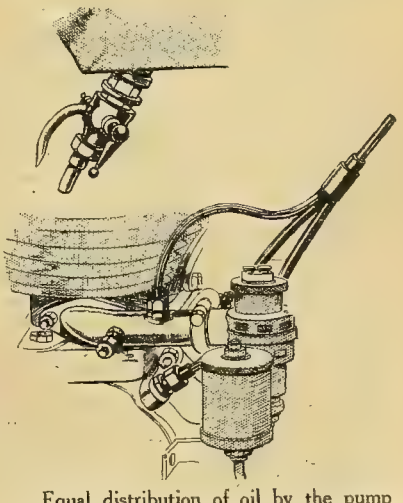
The lubrication is by hand pump, but the oil is equally distributed to the engine, passing simultaneously to three pipes, two of which lead to each main bearing, while the centre one leads to the induction pipe. The oil pipe is also provided with a three-way cock, so that it is easy to fill an oil-can from the main supply.

One of the best features of the machine is the neat method employed in shielding the gear box, magneto chain, and countershaft chain.

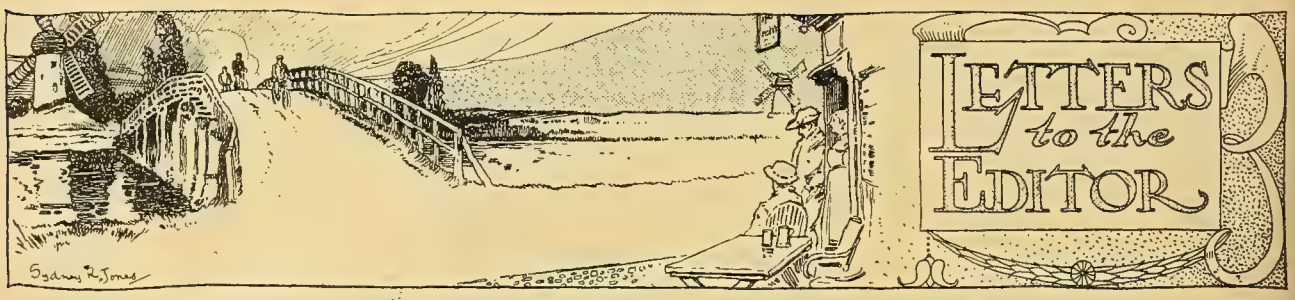
The machine is finished all black except the handle-bars, while 2¼in. tyres form part of the equipment. Fitted with footboards, a Lycett saddle, and Druid forks, it is a thoroughly practical little lightweight.



Messrs. Brown Bros. have given careful thought to the problems of lightweight design in their 2½ h.p. Vindec. The clean lines of the power unit and the detail finish are very commendable.



Equal distribution of oil by the pump system is the aim of the three oil leads in the lubrication of the Vindec. (Inset) The drain pipe at the main oil tap.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

SPARKING PLUG LONGEVITY.

Sir,—One hears of many cases of faulty sparking plugs. I have the original Bosch plug in my 1913 Triumph, which has run 27,000 miles. The plug never requires attention, and never soots up. What is the matter with the modern plug?

GEO. GRIBBON.

REGISTRATION.

Sir,—I was very interested in a recent article on the registration of motor cycles, and perhaps it would be of interest to many to know how a certain county council treated my application for transfer of numbers.

On May 7th this year I bought an outfit second-hand, and a few days later wrote to the aforementioned county council asking that the numbers might be transferred, enclosing the usual fee. Nearly three months afterwards I was informed that this had been carried out! During that time I had covered something like 2,000 miles, and apparently had every chance of being summoned for riding an unregistered machine. The question arises, on whom would the blame have rested—the county council or the rider of the machine?

Birmingham. 5-6 JAMES.

ELECTRIC LIGHTING.

Sir,—I have read with interest the recent discussions on accumulators for electric lighting, and notice that a great many correspondents have been "let down" through short circuits due to paste falling from the plates.

It may be interesting to those readers who have had trouble to know that I have used a Fuller block accumulator for five years, using it daily all the year round, and riding on country roads of various conditions. I have never been let down by this accumulator; bulbs go occasionally, but I carry spares.

I carry no gas outfit as a stand-by, my lamps are all designed for electric light, and I find the system more reliable than any acetylene lamp. I carry the accumulator under the seat in the sidecar in a wooden box, painted inside with anti-sulphuric paint. MALCOLM J. ROUND.

SPARKING PLUGS AND LIGHTWEIGHTS.

Sir,—We have read with the greatest interest the contribution by "Ixion" in *The Motor Cycle* for October 21st, and we are particularly interested in his remarks about two-strokes, in view of the fact that we have lately been carrying out experiments with this type of machine, and we hope that the following remarks may be of some assistance to your readers.

It appears to us that a great deal of four-stroking at low and high speeds can be cured by the use of a suitable plug. This, of course, does not apply to engines which have inherent faults in design. Using a plug with a stout body electrode, we find that there appears to be a good chance of strings of carbon forming between the points, thus rendering the path between them of comparatively low resistance. This robs the spark of its correct amount of capacity component and the ignition becomes inefficient. In some cases this is sufficient actually to cause short circuiting of the points and a complete failing of ignition. Using a plug with wire points, we find that this trouble is overcome; but, unfortunately, pre-ignition is often caused by the point becoming incandescent and not cooling sufficiently before the next compression stroke. We have also noticed that, with certain types of plugs, after running for some considerable time without showing any obvious signs of misfire or pre-ignition the engine becomes what one might term woolly, and loses its liveliness. In view of these results, we have gone further into this matter, and have great hopes of being able to supply two-stroke users with a plug which overcomes all these failures in the near future, as, so far, the tests have proved eminently satisfactory. At the same time, we think that this plug will also overcome the trouble "Ixion" complains of when riding new machines.

The trouble previously has been that a plug which will stand in excessive heat is not usually also suitable for excess of oil. "Ixion" will no doubt have noticed, especially amongst car users on Brooklands track, that if the racing cycle or motor is driven home, it is usual to change the plugs for a different type, owing to the fact that the plugs that were in use on the track will not stand the cool and oily running conditions of the engine on its way home at touring speed.

We may say that we have no intention of putting this plug on the market until it has been thoroughly proved by practical running experience on the road and on the track that these little troubles have been overcome.

APOLLO PLUG MANUFACTURING CO., LTD.,
COLIN H. GARDNER,
Graduate I.E.E., Technical Representative.

MEN OR MACHINES.

Sir,—"Interested" makes a good point when he claims that the post-war machines are not up to pre-war standard—hence the screams from certain manufacturers before they were much hurt, but I do not think that he has got to the root of the trouble. The only thing of value, proved by the mass of gold medals awarded, was the quite manifest fact that these frightful places can all be climbed with ease by a decent lightweight.

The first thirty-one names in the report comprise all the entrants of and under 2¾ h.p. These include two experimental machines which were not up to the job, leaving twenty-nine, fourteen of which secured gold medals. Therefore I say that the men, who did all the squealing, were below pre-war quality, and not their machines.

In 1913 the Harrogate Club held an invitation club competition round the Cleveland Hills. If I remember rightly, Ilkley, Crossgates (Leeds), Bradford, and Newcastle, sent teams, none of whom were paid to ride that rough round.

Nevertheless (or, perhaps because of it), there were no complaints, and more than two-thirds of these ignorant amateurs, of whom I had the honour to be one, took Rosedale Bank without any footing.

Unclimbable, forsooth!

Leeds. RUFF RHODES.

A MYSTERIOUS ACCIDENT.

Sir,—Mr. F. A. Boyce's letter under the above heading, is identical with an experience of my own. I do not pretend to explain it, but the facts are these:

Last June, I had been a short journey (thirteen miles each way), and left my home town to go to a village four miles away. I remember everything quite distinctly, for one and a half miles, and then no more until nearly twenty-four hours later, when I regained consciousness.

I was carrying a pillion passenger, who says that, for over a mile I seemed to have no control over the machine, and that, although spoken to, I did not answer, apparently having lost consciousness. After a few wobbles, came the accident. I simply hit the roadside and the machine turned turtle. To this day I remember nothing of the accident itself: in fact, I must have ridden over one and a half miles, quite unconscious. I had not ridden thirty miles that day, was quite sober, and in ordinary health. I

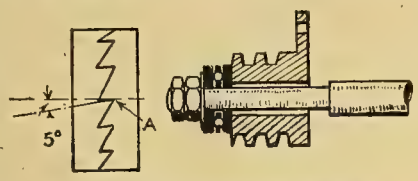
have since found out that my heart has very slight valvular trouble, and the doctor attributes the accident to this reason, though I have done hundreds of miles both previously, and since, with no trace of the same.

Buxton. MYSTIFIED.

[This correspondence must now close.—ED.]

A READER'S ALTERATIONS.

Sir,—Perhaps you will find the following alteration in the kick-start and clutch of my 1919 4 h.p. Douglas to be of some value to your readers who are riding similar machines.



Alterations to a Douglas clutch and kick-starter referred to by Mr. W. A. Peel.

In the first place, take the kick-starter. I found that when I used the foot lever the sliding part of the clutch slipped out, owing to the square face of the teeth wearing at the point A, and tending to make the square face such that would help it to slip out, so I undercut all the teeth in a universal cutter grinder, as per sketch, and I find this has overcome the trouble.

My next alteration took place on the clutch drawbolt. The cone that screws on to the drawbolt crumpled up, and the corresponding race on the drawnut also broke, so I annealed the drawnut, and reduced it in length on ⅛in., after which I put in a thrust washer bought from the stock of Messrs. Hoffmann. You will see by the sketch the change that has been made and how I used the existing nuts to secure the thrust washer. This, I find, has worked admirably on my machine. WILLIAM A. PEEL.

THE UMBRELLA COAT.

Sir,—Your correspondents might find something to suit them if they would write to the Hurricane Smock Company, "The Albany," Liverpool. Their smock has a head opening with expanding gusset, and the neck can be made to measurement. The material *is* waterproof, even under pressure, it is light and doesn't crack, and can be had in seven shades as well as black. They also make a fingerless glove with wind guard (of same material) which goes well over a woollen glove, the palm covered with paramatta.

Usual disclaimer. HADSUM.

Horsham.

Sir,—In reply to your correspondent, Capt. F. A. Summers, who enquires as to the survival of the "umbrella coat," I would say that I purchased one from Messrs. Dunhills, Ltd., of 2, Conduit Street, London, W., in 1903, and have it still. It is made of a stout khaki-coloured waterproof material, and has proved to be most reliable, especially so during the early days of motor driving, before the glass windscreen was in use. Some years ago I had the indiarubber yoke—through which one had to force one's head—removed and an ordinary buttoned opening and turned-down collar made. This year I have had it converted into a long motor cycling jacket by the addition of pockets and belt, and the whole garment opened up down the front and made to button up. I use it in conjunction with Brooks patent spring leggings, and find the combination most effective against rain.

M. S. RIACH (Colonel).

Sir,—With reference to the "umbrella coat" mentioned in your issue for October 21st, may I, as an old D.R., enquire whether the W.D. type of poncho coat as issued to the Signals D.R.'s in France is now purchaseable?

This type, originally made, I believe, for the War Department by Anderson, Anderson and Anderson, and later by many contract firms, gained the praise of all connected with "the road." It was of mackintosh with a heavy cloth lining and one inside pocket, wrist straps and wind cuffs, mackintosh belt, and brass buckle and eyelets. It slipped over the head (the only objection, when it was still wet) and had a good collar.

In the summer time they were inevitably warm, and most of the boys slit them down the front; but this made them useless for riding in rain.

These overalls were splendidly made (with trouser overalls to match, though these would be rather heavy for ordinary civilian riding), and runs of sixty and seventy miles at least daily in a week of heavy rain were made without wet penetrating.

I have wondered if any firm stocks any W.D. surplus, or makes a civilian copy, as they are rarely seen except when worn by ex-D.R.'s who smiled at "clothing indents," and counted overalls as "souvenirs" for post-war riding.

H. F. BIRT.

A MODERN JUGGERNAUT.

Sir,—While I agree with "Twenty Years on the Road" that it is up to the motor cyclist to be on the alert when turning from one road to another, I venture to suggest that the driver of a fire-engine, though he go all out on the straight, might also feel an obligation to slow down when he knows he is approaching dangerous cross roads.

In conclusion, I think "Twenty Years" will agree with me that heavy vehicles, however rapidly they be allowed to travel, and however urgent their need, should decrease their speed at dangerous cross roads. DOUGLAS.

Coventry.

BEATING THE PUNCTURE FIEND.

Sir,—When are we going to see the last of the pneumatic tyre? Why should we put up with trouble which would be ridiculous on anything but a motor vehicle? Having culminated seven years of incessant tyre trouble with a *grand finale* consisting of four bursts and three punctures in thirty miles, and forty miles on the rims, I have sworn never again to ride a machine shod with pneumatics.

The resigned stoicism with which we accept the pneumatic tyre as inevitable is amazing. Endless attempts to improve already perfect engines, carburetters, and plugs are welcomed as the work of genius, but he who suggests abolishing the air-bound wheel is regarded with pitying contempt.

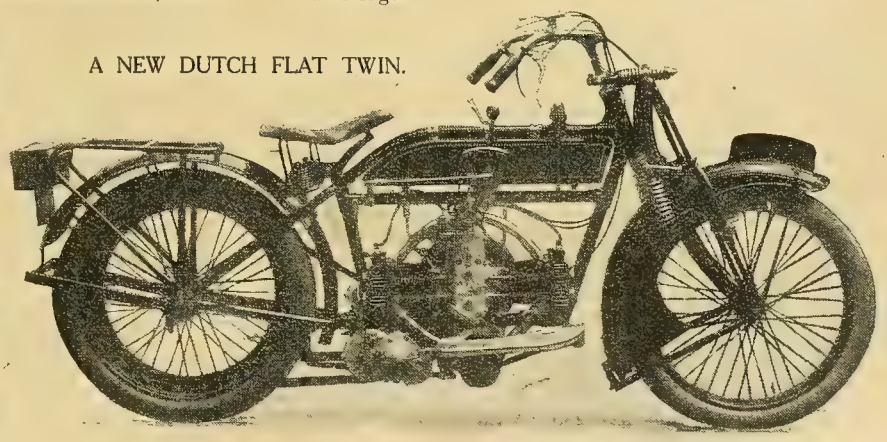
It is time we realised that the tyres are the only things on modern machines that really need radical reform. One can rely upon everything else—even upon belts and chains, if one keeps an eye upon them—but no one can foresee and prevent tyre trouble, even if he carry two spare wheels. (Imagine a locomotive engine or horse and trap carrying spare wheels! Ye gods!)

The Rapson and puncture-proofed tyres I deplore, as they will delay the inevitable ultimate demise of the pneumatic.

I shall build my 1921 machine myself. It will have an 8 h.p. J.A.P. engine, Binks carburetter, Philipson pulley, frame doubly sprung fore and aft, and Nap or Rubberine-filled tyres. And when I pass people repairing tyres I shall smile the superior smile of one who has put away childish things! NEVER AGAIN.

Cambridge.

A NEW DUTCH FLAT TWIN.



The 1921 Eysink, manufactured throughout at Amersfoort, Holland, and having a three-speed gear and cylinders of 68 × 70 mm.

THE WEARING QUALITIES OF THE 3½ H.P. SIDECAR MACHINE.

Sir,—I must protest against "Eldon's" letter of the 14th October, in which he says that it is heart-breaking to see a 3½ h.p. machine hauling a sidecar. My machine, a Russian Government model 3½ h.p. Sunbeam, with coach-built sidecar, has just completed 16,000 miles, without a single replacement being necessary.

The machine, in June of this year, carried two passengers weighing eleven stone each, and 70 lb. of luggage from Buxton to Inverness and back, going *via* Stirling and Oban, and back by Grantown-on-Spey and Braemar. All hills were negotiated easily excepting the hill at Tomintoul, where one passenger had to dismount. J. B. GREAVES.

CHAINS.

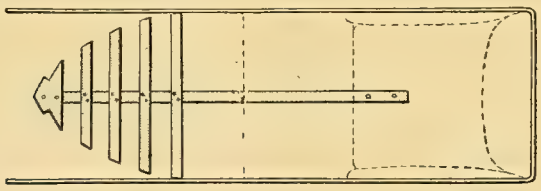
Sir,—For the benefit of "Simplicitas" and others, I should like to give my experience of naked driving chains. My machine is a 6 h.p. Royal Enfield, and the driving chain was removed at 9,500 miles—not because it had broken, but because, in my opinion, it had "had sufficient." It was a Renold, and the stretch was approximately ½in. in ninety-six links (5ft.). The fifteen-tooth driving sprocket was changed at 8,000 miles. The enclosed chains have been adjusted twice, at 5,000 miles and at 9,500 miles, and are in excellent condition at 11,000 miles.

If "Simplicitas" *boils* his chains in tallow and blacklead, he is seeking trouble. Tallow *boils* at about 660° F., but *melts* at about 90° F. The tempering temperature of the steel for chains is in the neighbourhood of 300° F., so that if the chain has been boiled he has lost the temper and exposed the chain to excessive wear where it could have been avoided. If he uses the tallow mixture and melts it, and puts the warm chain into the mixture, there is nothing to be said. HOILEY.

Manchester.

MAKING A SIDECAR.

Sir,—On page 440 of a recent issue of your "canny" journal there is a description of the making of a sidecar. In 1915 I made a body of similar outline, but I venture to think that my method was simpler than that shown. I will not take much of your valuable space by giving a lengthy description: it will suffice if I give what I consider the most valuable tip



The letter of "Top Heavy" gives a very useful tip for easily bending the sides of a home-made sidecar body. The sketch shows a jig for ensuring a symmetrical construction.

that an amateur attempting to build a sidecar without a coachbuilder's tools and jigs could have.

If the aspirant will steam his three-ply over the "set pot," or copper, that is found in washhouses, and, when thoroughly steamed, put the wood between the rollers of the mangle, he will find, by pressing downward while someone turns the mangle handle, that the wood can be bent to comply with the exact shape required without the use of jigs. Moreover, the grain of the wood will be kept in place, as it has a tendency to rise in places. Of course, the sooner after "mangling" to shape it is beaded to place the better.

If you have space enough, I might venture to suggest that the two side pieces of ½in. canary pine, bent to shape in the manner described for the three-ply, will do away with all frame work except the seat and floor. Of course a nose piece will be required, cut with grooves to receive the sides of the canary wood and the top and bottom three-ply pieces of the toe. The back (with or without a locker) may be bent in the manner described. This method may make a heavier construction than that depicted in the article.

One other item of interest is a moulding for edges. That is made from cane, half or quarter moon in shape, and bends in any required direction with ease. TOP HEAVY.

Newcastle-on-Tyne.

AN IMPORTANT POINT IN HAND SIGNALLING.

Sir,—I have a little grouse to make on the subject of hand signalling. There seems to be a prevalent idea that, having given a signal, one is thereby entitled to pull across the road without looking.

The signalling idea is for the prevention of accidents, and does not give the right of the road. It certainly should not take the place of ordinary precautions. The habit referred to above is particularly noticeable with cyclists, though it is by no means confined to them.

Suppose a car to be overtaking a cyclist. Cyclist puts out his hand, and turns down road on the right. Result, the car has to pull up to avoid running the cyclist down. Now the car, proceeding along the main road, has obviously the "right of the road," and the cyclist should let him pass before turning.

I think the fact that straight road traffic has a prior right should be placed prominently before the public. A vehicle turning *into* a side road should use equal precautions to one emerging from it, signalling notwithstanding.

Before the hand signalling fetish came into existence the situation seldom arose, because the cyclist *looked* and saw he had not time to get across in front of the car. In my opinion, hand signalling is likely to become a danger rather than a safety unless this practice is put a stop to. In a street full of traffic, where everyone is travelling at more or less the same speed, it is, of course, a somewhat different matter; but in quiet streets, the fact of putting out a hand is not sufficient to warrant a swing across the road without a preliminary glance behind.

I consider that every car, at any rate every closed or hooded car, should carry a mirror. A cyclist or motor cyclist can and should look round. BY 6617.

London, S.E.25.

SUMMARY OF CORRESPONDENCE.

The aluminium number plates made by Messrs. Martin Bros., 90, Brunswick Street, Hackney Road, E.2, are highly praised by Mr. W. A. Fell Smith, Kensington Park Gardens, W.11.

"Eldon's" opinion, in our issue of the 14th inst., that it is heartbreaking to see a 3½ h.p. machine hauling a sidecar, has attracted a shoal of admirers and satisfied users of light sidecar outfits to the defence of their choice. For instance, "M.T.," writing from Land's End, reports 27,000 miles in twenty months on a 3½ h.p. Sunbeam outfit, which was second-hand when it came into his possession twelve months ago.

The A.C.U. "get-you-home" scheme has also proved its worth in three instances notified to us by members recently.

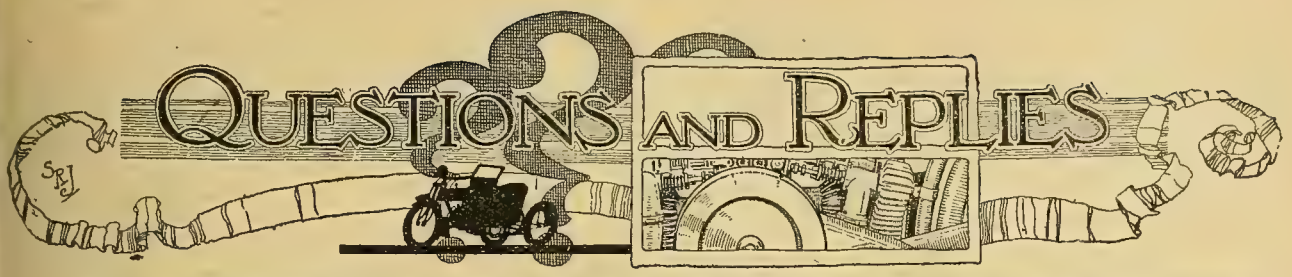
This week various readers express satisfaction with the products or business methods and service of the following firms: Messrs. J. A. Prestwich and Co., Bayliss, Thomas, and Co., Dunlop Rubber Co., Bradbury and Co., Cowey Engineering Co., Scott Motor Cycle Co., A. J. Stevens, Phelon and Moore, and the Electric Ignition Co.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Hot Crank Case.

Since taking down my 2½ h.p. J.A.P. I have been troubled with the crank case getting very hot during a run. I have changed first one ring and then the pair (and the cylinder does not seem to be scored), but still it continues, and gets so hot that the hand cannot be kept on it. Could you please advise me?—A.F.R.T.

The cause of the crank case getting hot may be due solely to conduction from the cylinder. If the engine is running well, there is no cause for you to worry.

Coasting on the Exhaust Valve Lifter.

I have lately purchased a 2¾ h.p. Douglas, and have been told never to let the machine run downhill with the exhaust lifted or I shall cause untold trouble. Can you please inform me what this trouble would be, or what damage this running would do to the engine?—H.E.G.

There is no particular harm in running down hill with the exhaust valve lifter raised, but there is a slight tendency to draw the oil past the piston rings, and on to the plugs if running down hill for any great distance with the engine shut off in this manner.

Fierce Clutch.

My machine is a 1916 Sunbeam and sidecar, and I have had the clutch down for cleaning purposes. All the plates (seventeen) were replaced dry, and in exactly the same positions. I now find that the engine propels the machine along, in all gears, when the clutch is "out." The nut holding the spring has been brought back by degrees, until there is only about half a nut holding, and the necessary adjustment done to the push rod, but this appears to have no effect. The plates themselves are, in my opinion, in good condition, and I must confess that I am entirely at a loss to know what to do next.—J.T.

The mistake you have made is in reassembling the clutch plates without oil. The metal-to-metal clutch of the Sunbeam machine requires a certain amount of lubrication with thin oil, and it is quite likely that in using the clutch dry you have seized the plates, and you may have the difficulty in dismantling them again. When reassembling, lubricate with thin castle oil.

Accumulator Charging.

Will you please tell me: (1.) If a dynamo constructed with permanent magnet and tri-polar armature will be suitable for charging accumulators (4 volt., 40 amp. hr.)? (2.) Dimensions, gauge, and quantity of wire, and any other information you can give?—W.E.C.

(1.) If the armature is suitably wound, it will be satisfactory for charging accumulators. (2.) We cannot give you the figures you require, as everything depends upon the strength of the permanent magnet and the speed at which the armature is driven. The finest wire to take, 4 amps., would be 16 or 18 gauge, as much of this as possible should be wound on to the armature, and the driving speed adjusted to give the required voltage.

IMPORTANT DATES.

Nov. 4th-13th—
International Automobile Exhibition, Olympia and White City

Nov. 29th-Dec. 4th—
Olympia Motor Cycle Show.

Dec 26th-27th—
M.C.C. London-Exeter Run.

Jan. 28th to Feb. 5th, 1921—
Scottish Motor Exhibition, Kelvin Hall, Glasgow.

Carburetter Flooding.

I have an Amac carburetter fitted to my 6 h.p. Clyno outfit, and it is flooding rather badly. There is a split pin fitted loosely to the spindle in the float chamber just above the float with about a quarter of an inch play up and down. Please say where this pin should be fixed, and what its weight should be? If a split pin is not used in this type, will you kindly inform me what is? The petrol float is quite airtight. How can I grind in the spindle at the base to ensure an accurate fit?—W.H.C.

The split pin on the float chamber needle of the Amac carburetter is located by means of a press collar, which is a tight fit on the needle itself. There should not be more than $\frac{1}{16}$in. up and down play between the needle and the float. The weight of the split pin is immaterial. For grinding in the float chamber needle valve, ordinary emery grinding paste is too coarse. Use paste metal polish. But it is preferable to fit an entirely new needle.

The Roads Over Dartmoor.

(1.) Is it safe to take my 4 h.p. Triumph sidecar outfit over Dartmoor, Exeter, to Two Bridges, where the road mounts to 1,500ft., and the gradients in the "Contour Road Book," 1904 edition, are stated to be "nearly all dangerous"? (2.) Are such roads too unfair on tyres, and likely to cause bursts? (3.) What is the following a sign of in the Sturmey-Archer hub gear? It seems to me when the top-speed is put in from bottom gear, then middle gear, that it sometimes, by the quick sound of the revolutions, with no increase in pace, goes back apparently to low gear. —M.

(1 and 2.) The roads in question are perfectly straightforward, but you must bear in mind that the "Contour Road Book" is written for pedal cyclists, and motor cyclists who use it must therefore make due allowance for the opinions of the writer. (3.) This trouble seems to be due to clutch slip.

Ignition Trouble.

About a fortnight ago the rear cylinder of my 1914 Douglas refused to work, which trouble I think I have traced to the firing. I reversed the plugs and find that either plug works all right on the front cylinder. I then tried new high-tension wire on the rear cylinder with no result. I again took off the connection, and tried the bare wire in the holes where the brush works and the rear cylinder fired immediately. I then put the wire on the plug, and held a loose wire to the magneto and the other end in the hole where the brush spring goes in; that worked all right. I then changed the brushes from back to front, and connected up again, and found the front worked all right, but the rear refused to act. Either plug when on the rear cylinder would give a fairly good spark out of the cylinder, but would not fire inside unless I held the bare wire on to the magneto. Would it be possible for the connection to short on to the body of the magneto?—S.W.

From your description of the trouble we imagine that the carbon brush holder is defective, and would advise you to replace it with a new one. Also make quite sure that the carbon brush itself is of sufficient length and works freely in its sleeve. When adjusting the magneto note that the contact breaker points separate equally for each cylinder.

Timing an Auto-wheel.

(1.) Please tell me how to time a Wall auto-wheel with automatic inlet valve? (2.) Does the screw of a U.H. magneto go through the magneto and touch the armature shaft? (3.) Where can I get a book upon magnetos to tell me all about them, both the overhauling and the working of them?—E.A.

(1.) You ignore the inlet valve and time the exhaust as follows: Set the exhaust valve to close just after the completion of the exhaust stroke. (2.) We presume you mean the screw holding on the contact breaker? This screws directly into the armature shaft. (3.) Practically all the information you require is given in "Motor Cycles and how to Manage Them."

Paraffin.

I should be pleased if you would answer the following: (1.) Would any mixture of petrol and paraffin be suitable for running a motor cycle? (2.) If suitable, what proportion is recommended? (3.) Would this mixture harm the carburetter in any way? (My carburetter is a Schleber automatic with cork float.) (4.) The advantage of this mixture would be its cheapnesss. What are its disadvantages?—G.E.C.

(1.) A motor cycle engine may be run quite satisfactorily on a mixture of petrol and paraffin; indeed, it may be run on paraffin alone, if first warmed up on petrol or benzole. (2.) At normal temperatures a mixture of equal parts of petrol and paraffin would give fairly good results, and it should be possible to start it without first priming the engine with pure petrol. (3.) The mixture would not do any damage to the engine or carburetter. (4.) The disadvantages would be the difficult starting, harsh running, and tendency to knock badly on hills.

Gudgeon Pin Working Loose.

Lately I was out for a run with an empty sidecar when I heard a terrible crack in the engine after accelerating for a stiff hill. When I dismantled the engine I found the cylinder head broken, also the piston broken in hundreds of pieces. I had plenty of oil in the crank case. My idea is that the timing had slipped, and retarded itself a long way. What is your opinion, please? Also (1.) What is the correct timing for 3½ h.p. Premier (three-speed, Armstrong gear as far as I know, a 1914 model)? (2.) What is the small pipe for that is fitted into the cylinder wall and empties itself into the exhaust box? (3.) Can a two-speed gear box be fitted to the frame of a 1914 Premier machine, and which is the best kind to get?—J.W.N.

In all probability the breakage of the cylinder and piston was due to the gudgeon pin locking screws (or pins) falling out and being jammed between the piston and the top of the crank case. Time the valves so that the exhaust closes when the piston has reached the top dead centre and the inlet is just commencing to open at the same point. (1.) The ignition should be timed so that the contact breaker points just separate when the piston is on top dead centre of the compression stroke, with the magneto control two-thirds retarded. (2.) The Premier engine is fitted with an auxiliary exhaust valve, which comes into action automatically when the piston approaches the bottom of its stroke. (3.) We do not know of any two-speed gear box which could be fitted to your machine.

EXPERIENCES WANTED.

"W.W.K." (Nottingham).—1920 Velocette; economy and reliability.

"8 J.A.P." (Woodford Green).—Any type of valve stem air leak preventers on V twin; their advantage as regards elimination of air leaks, reduction of noise, ease of starting, and flexibility; disadvantages, if any.

"C.E.V." (Liverpool).—5 h.p. Zenith (1920 model); consumption, reliability, and capacity for light sidecar work.

RECOMMENDED ROUTES.

TOOTING TO WARMINSTER.—A.D.M.

Kingston-on-Thames, Staines, Bagshot, Hartley Row, Hook, Basingstoke, Whitchurch, Andover, Amesbury, Warminster.

HEREFORD TO SUNDERLAND.—J.E.P.

Hereford, Worcester, Upton Snodsbury, Wixford, Stratford-on-Avon, Warwick, Coventry, Stoke, Wolvey, Narborough, Leicester, Newark, Tuxford, E. Retford, Bawtry, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Leeming Bar, Catterick Bridge, Scotch Corner, Baston, Darlington, Aycliffe, Durham, Sunderland.

SPEEDOMETER READING AT NIGHT.

A Wooler refinement: The speed indicator is fixed to the front forks, where it is illuminated from the vent holes of the head lamp

SPARKLETS

Leaves Levis.

G. Kuhn, the Levis exponent, has joined the Verus staff.

No Matchless Cycle Car.

Messrs. H. Collier and Sons, the makers of the Matchless motor cycle, advise us that there will *not* be a Matchless cycle car next year.

Lightweights Popular.

Over 3,000 New Hudson lightweights were sold during the present year, which shows the popularity of the low and light machine. The New Hudson has 24in. wheels.

British Magnetos Still Ahead.

Despite the fact that the rules of the recent Air Ministry competitions for aeroplanes and seaplanes permitted foreign magnetos to be used, the machines which carried off the eight awards were all equipped with British ignition apparatus.

A Sociable Sidecar.

The three-wheeler which was mentioned as the Austin in our issue of the 14th inst. is to be known as the A.S.C. (an abbreviation for the Austin Sociable Combination). At the last Southend speed trials this machine secured several firsts averaging 37 m.p.h. from a standing start.

An Infringement.

It has been found that the Contour sidecar shield, recently described in our pages, is an infringement of Messrs. Easting's well-known shield. We understand, however, that the matter has been amicably settled between the parties concerned.

A Practical Staff.

The proprietors and staff of Messrs. Ballard's Motors, of 92, Gloucester Road, South Kensington, are practical riders to a man, as is shown by a list of their successes which has been forwarded to us. These include many wins and gold medals both at Brooklands and in reliability trials.

Going to Australia.

The well-known Midland motor cyclist C. R. Little, who drove one of the A.J.S. 5,000 miles benzole test machines, shortly leaving for Sydney, where he intends to commence a motor cycle sales and repair depot. His object is to specialise on British machines and accessories, believing that the overseas market is favourable if suitably worked.

"Credit to whom . . ."

The sidecar referred to in our description of the road test of the 8 h.p. Zenith, on page 435 in the issue of October 14th, was described as a Mulford. This is quite correct so far as the chassis is concerned, but Messrs. Vivian Hardie and Lane, Ltd., 24, Woodstock Street, London, W.1, are responsible for the body, which is manufactured by them specially for Zenith Motors, Ltd.

York and District M.C.

This club held its prize distribution at the Davy Hall, York, on Wednesday evening, October 27th. Dinner was served at 7, after which, at 8.15, the prizes were presented by the Lord Mayor (Alderman E. Walker), one of the vice-presidents.

Fylde M.C.

The results of the reliability trial of the Fylde Motor Club over a course of seventy-nine miles are now available. They are as under :

SOLO CLASS.—1, M. Parkinson (3¾ Scott); 2, J. Ramsden (4 Harley-Davidson); 3, J. F. Moss (3½ Rudge).

SIDECAR CLASS.—1, W. Lyons (7-9 Harley-Davidson); 2, H. Penswick (6 A.J.S.); 3, F. Taylor (8 Sunbeam).

N.M.C.F.U. (Barrow and District).

A very interesting reliability trial took place on October 24th as a final event for 1920. The course was 138 miles—Barrow to Appleby and Penrith, then up Kirkstone Pass back to Barrow. The final results were as follows : 1, W Ashley (3¾ Scott); 2, E. C. Peacock (3½ N.U.T.); 3, H. Jackson (7-9 Indian sc.); 4, W. J. MacKenzie (5-6 Rover).

Sheffield and Hallamshire M.C.C.

The Sheffield and Hallamshire M.C.C. held a stiff competition on Saturday, October 23rd; but, in consequence of many competitors taking a wrong turn, the trial will be run again on November 4th. The course was the stiffest experienced of all the competitions this year. It was only fifty miles, but of the gruelling type.

On the following day fifteen keen members were taken over a very stiff course, and up a second Park Rash, through many watersplashes, and finishing up with Pinsley Bar.

Bedford and District M.C.

The trial for the Lindley Shield, Thurburn Cup, and Berrie Cup was run off most successfully on Thursday, October 21st. The winning team, who gain the Lindley Shield, were : G. W. Johnson (8 Zenith sc.), G. H. Hartop (7-9 Harley-Davidson sc.), and T. French (2½ Sparkbrook).

The Thurburn and Berrie Cups go to B. B. Bates (8 Enfield sc.) and M. G. Horne (3½ Triumph-Jap) respectively, while the following gain bronze medals : H. Ormerod (8-10 Henderson), J. Simpson (2½ Hobart), J. C. Shevin (3½ Sunbeam), A. B. Morris (2½ Clyno), H. H. Berrie (2½ Revere-Villiers), G. Bryant (2¼ New Hudson), E. A. Bristowe (7-9 Indian sc.), W. H. Holland (6 A.J.S. sc.), A. F. Lindley (8 Rex-Blackburne), and H. Green (4 Triumph sc.).

Week-end Club Events.

NOV. 6.—WOOLWICH, PLUMSTEAD, AND DISTRICT M.C. OPEN MATCHLESS CUP TRIAL.
Nov. 6.—Warrington M.C.C. Speed Trials.
Nov. 7.—Leeds and District M.C. One Day Trial.

Westmorland M.C.C.

The committee of this club announces that the annual dinner and prize distribution will be held at the County Hotel, Kendal, on November 18th, at 7 p.m. Tickets, 7s. 6d. each, may be had from the following : W. D. Stewart, Beechwood Cottage, Kendal; R. Harrison, Queen's Place, Kendal; R. P. Montgomery, Bank Top, Kendal; L. W. Somervell, Brantfield, Kendal; J. W. Nelson, Kentrigg, Kendal; or W. Westwood, 9, Gillingate, Kendal. An early application should be made, as no tickets will be issued after November 11th.

The Motor Cycling Club.

The following is the programme of the chief events to be organised by the Motor Cycling Club during the next twelve months :

1920-1921.

December 27th-28th.—The London-Exeter Run.
March 26th (Easter).—The Jarrott Cup Run.
May 13th (Whitsun).—The London-Edinburgh Run.
June 25th.—Inter-club Team Trial for *The Motor Cycle* Challenge Cup.
October 24th.—One-day Sporting Trial for Motor Cycles.
December 26th.—Winter Run.

Lancaster, Morecambe, and District M.C.C.

A reliability trial for club members took place on October 24th. A start was made at 10.31 in beautiful weather, and although the course was severe, all competitors finished. In the solo classes G. H. Ducksbury (3½ Norton), R. F. Mansergh (3½ N.U.T.), C. R. Wolfendale (6 Zenith), and W. G. Hardman (3¾ Scott), tied for first place with 100 marks (none lost). However, the secret check report made Ducksbury the winner, with Hardman second. Other results are :

SIDECAR CLASS.—1, C. E. Barrow (6 A.J.S.), 100 marks; 2, E. McCormack (6 A.J.S.), 92.

TEAM PRIZE.—R. F. Mansergh (3½ N.U.T.), C. R. Wolfendale (6 Zenith), and R. L. Ducksbury (8 Clyno sc.), 286 marks.

MERITORIOUS PRIZE for Best All-round Performance.—W. Atkinson (1914 3½ B.S.A. sc.).

BRONZE MEDALS.—J. Count (3¾ Scott), 87 marks; R. Foxcroft (3 A.B.C.), 88; W. Powell (2¾ Douglas), 90; J. Whalley (3 A.B.C.), 90; A. Bell (4 Indian), 90.

A smoking concert will be held at the County Hotel, Lancaster, on November 10th, at 7 p.m., and the club run to London starts on November 28th.

Warrington M.C.

Closed speed trials will be held on a private road, kindly lent by Mr. G. T. Sproston, at Catten Hall, Kingsley, on Saturday, November 6th. In addition to awards for the various capacity classes, there will be special prizes for fastest time by various individual makes of machine.

Cape Peninsula M.C.C.

A 200 miles road race, on October 4th, from Killarney (ex Potsdam) to Saldanha Bay and back, resulted in a success for a British machine in the solo class, while the sidecar award went to an American outfit. The results were as follows :

SOLO CLASS.—1, J. Walker (Douglas); 2, J. W. du Toil (Indian Scout); 3, Percy Flook (Douglas).

SIDECARS.—1, P. Lawrence (Indian sc.); 2, P. E. Loubser (Harley-Davidson sc.).

Dewsbury and District M.C.C.

The club held a fifty miles reliability run on October 23rd on a route from Dewsbury to Huddersfield, Holmfirth, Dunford Bridge, Woodhead Inn, Holmfirth, and Dewsbury. There were open and secret checks, and observed hills. The results were as follows : 1, A. S. Day Trophy, H. Gutteridge (8 New Imperial sc.) lost 9½ marks out of 200; 2, A. S. Day special prize, S. M. Haigh (3½ Ariel sc.) lost 10 marks; 3, club special prize, J. B. Ellis (8 Morgan) lost 10¼ marks.

Stockport M.C.

Ninety-five entries were secured for the speed trials which were held on October 23rd. Some good sport was witnessed over a flying half-mile, with the following results :

CLASS 1 (250 c.c.).—1 (club silver medal), O. E. Carter (2¼ Levis); 2 (W. Vine's prize), G. Hallam (2½ Dreadnought); 3, H. Shelton (2½ Wilkin).

CLASS 2 (350 c.c.).—1 (club gold medal and K. B. Nixon's prize), G. Cowley, sen. (2¾ A.J.S.); 2, S. Crabtree (2¾ A.J.S.); 3, S. Eastwood (2¾ Royal Ruby); 4 (T. Davies's prize), H. Clayton (2¾ Marloe).

CLASS 3 (500 c.c.).—1 (club gold medal), G. Cowley, jun. (3½ Norton); 2 (club silver medal), T. Simister (3½ Norton); 3, E. S. Abram (3 A.B.C.).

CLASS 4 (750 c.c.).—1 (club gold medal), G. Cowley, jun. (3½ Norton); 2 (club silver medal), T. Simister (3½ Norton); 3 (club bronze medal), E. S. Abram (3 A.B.C.).

CLASS 5 (Unlimited).—1 (club gold medal and gold medal for fastest time of day), H. Reed (8 Dot); 2 (club silver medal), E. Bottomley (7-9 Harley-Davidson); 3 (club bronze medal), F. Boulton (7-9 Indian).

CLASS 6 (350 c.c., Sidecar).—1 (club silver medal), S. A. Crabtree (2¾ A.J.S. sc.).

CLASS 7 (600 c.c., Sidecar).—1 (club silver medal), G. Cowley, jun. (3½ Norton sc.); 2, O. Carter (3½ O.C.-J.A.P. sc.); 3, T. Simister (3½ Norton sc.).

CLASS 8 (1,000 c.c., Passenger).—1 (club gold medal), G. Cowley, jun. (3½ Norton sc.); 2, E. Bottomley (7-9 Harley-Davidson sc.); 3, T. Simister (3½ Norton sc.).

CLASS 9 (Unlimited, Passenger).—1 (club gold medal), G. Cowley, jun. (3½ Norton sc.); 2, H. Reed (8 Dot sc.); 3 (George Cowley's prize), E. Bottomley (7-9 Harley-Davidson sc.).

Next Year's Cars.

To-morrow's issue of *The Autocar* will contain a forecast and guide to the Car Shows at Olympia and White City.

Two-stroke Sidecars.

The single-cylinder two-stroke as a sidecar machine is coming to the fore. In this issue we place on record an A.C.U. observed demonstration of the 3 h.p. Ivy sidecar outfit in the Old Wyche, and also some impressions of the interesting Dunelt on the road.

1921 Harley-Davidsons.

The success of the Harley-Davidson in its present form has resulted in the manufacturers not making any startling alterations for 1921.

Among the new detail improvements incorporated are new dust protectors to the front and rear hubs, valances to the front mudguards, slightly wider tanks, giving a capacity of about three gallons, an inspection hole in the chain case through which the condition of the chain may be verified, and heavier spokes in the rear wheels. In fact, the only conspicuous means of telling a 1921 from a 1920 model is the presence of the valances to the front guards.

Second-hand Prices.

There were some very low priced machines on offer in our classified advertisement columns last week: but not many. This accounts for the wide gap between the highest and lowest figures in the following list; and close examination of the actual pages will show that the *average* fall in values is still remarkably light.

A.B.C., 3 h.p., 1920	£110–£150
A.J.S., 6 h.p., sidecar, 1920	£175–£250
B.S.A., 4½ h.p., sidecar, 1920	£130–£175
Clyno, 5-6 h.p., sidecar, 1916-17	£65–£130
Douglas, 2¾ h.p., 1916	£45–£68
Douglas, 4 h.p., sidecar, 1920	£110–£160
Enfield, 8 h.p., sidecar, 1920	£150–£177
Harley-Davidson, 7-9 h.p., sidecar, 1920	£175–£210
Indian, 7-9 h.p., sidecar, 1920	£165–£210
Matchless, 8 h.p., Model H., sidecar, 1920	£160–£230
Norton, 4 h.p., sidecar, 1920	£125–£145
P. & M., 3½ h.p., sidecar, 1919-20	£95–£135
Rudge-Multi, 3½ h.p., 1920	£80–£100
Scott, 3½ h.p., 1920	£100–£125
Sunbeam, 3½ h.p., 1920	£140–£160
Triumph, 4 h.p., W.D., 1916-18	£75–£100
Triumph, 4 h.p., sidecar, 1920	£140–£180
Zenith, 8 h.p., sidecar, 1920	£128–£198

Over-development.

Apropos our par. last week on the light car owner who bemoaned the over-development of his machine, the following extract from *Motoring in South Africa* shows that over there some people have the same feeling with regard to the sidecar. " . . . the makers of modern sidecar outfits would seem to be appealing to the small minority of motorists who have a pocket deep enough to pay for the last luxurious detail in motor cycling. There is a splendid opportunity for . . . . a plain serviceable outfit of six to eight horse-power to incorporate three speeds and kick-starter . . . . shorn of all frills in the way of electrical details, spring frames, spare wheels, etc. . . ." This is worth attention by makers who have Colonial aspirations and also, perhaps, by those who have not.

THE MOTOR CYCLE

Special Show Numbers

1920

November 18th—
LIGHTWEIGHT NUMBER.

November 25th—
SHOW FORECAST.

December 2nd—
SHOW REPORT.

December 9th—
PASSENGER NUMBER.

165.6 m.p.g. with a 2¾ Douglas.

We have before us the official report of the A.C.U. test of a Degory No-jet carburetter on a 1919 W.D. 2¾ h.p. Douglas. The report states that the petrol tank was emptied and refilled with six pints of No. 1 Shell petrol. The carburetter was fitted with choke tube No. 12. A non-stop was made from Hounslow to Reading and back at an average speed of 23.49 m.p.h. The petrol consumed for the 58½ miles was at the rate of 165.6 m.p.g. The weather was fine and windless, and the road surface was in fair condition.

A second test on Brooklands with the same carburetter and choke tube showed that the machine was capable of a speed of 48.65 m.p.h.

Passenger Machines.

An interesting three-wheeler will be the sole passenger machine to be marketed next year by a well-known motor cycle firm.

The Brussels Show.

Brussels is to have a motor show on December 10th to 19th, when several motor cycles will be exhibited, including the Douglas.

Miniatures at Olympia.

Among the additional "entrants" for the Olympia Show are the makers of the Unibus, Whippet Scooter, Abbottsford three-wheeler, and The Kenilworth.

A Sign of the Times.

Several very interesting new models will shortly be described in *The Motor Cycle*—and very few are of the 1,000 c.c. variety. Medium-powered outfits will be in greater favour than ever next year.

Sidecar Taxicabs.

Police authorities are beginning to realise the possibilities of the motor cycle taxicab, and licences are now being granted in various districts. Before very long it is anticipated that quite a number of garage proprietors and motor agents will take up the sidecar taxicab, as, owing to its economy, and comparatively high earning capacity, it must prove a profitable venture. A well-known Nottingham firm of motor cycle manufacturers are specialising in this class of "commercial" sidecar, and will have an exhibit at Olympia, as will at least one other firm, who are designing a special machine for this service.

Racing in Orange Free State.

The sixty-four mile motor cycle race for the Continental trophy, under the auspices of the Orange Free State Automobile Club, was run in September.

The following were the competitors and their handicaps: C. R. Fyffe (two-stroke Clyno), 30m. start; C. G. Robinson (B.S.A.), 14m. 38s.; H. Traubman (B.S.A.), 14m. 38s.; J. L. Kruger (T.T. Triumph), 8m. 42s.; E. L. Mayhew (Indian Scout), 8m. 42s.; G. F. Joubert (Harley-Davidson), 30s.; R. J. Blackburn (Harley-Davidson), scr.; and D. Weber (Indian), scr.

In spite of the fact of having to change a tube, C. R. Fyffe (Clyno) completed the first lap in 61m. 57⅘s. He retired at the control owing to tyre trouble. C. G. Robinson (B.S.A.) carried off the trophy, doing the course in 1h. 23m. 50⅘s. H. Traubman (B.S.A.) secured second place in 1h. 34m. 34⅕s. J. L. Kruger (Triumph) suffered tyre trouble in both laps, but got home third, riding nearly half the last lap on a flat tyre.

Another A.C.U. Centre.

Efforts are being made by the Ilkley M.C. and L.C.C. to form an A.C.U. centre in Yorkshire.

Lightweights.

Trials for lightweights are now being organised overseas, and the reliability of British miniatures is showing up to advantage.

Yellow Wheels.

Yellow wheels are becoming quite the vogue in American motor cycles, and there is something in their favour. Yellow does not show up the dirt so much as black.

A Royal Motor Cyclist.

The late King Alexander of Greece was an active supporter of many forms of sport, and was particularly interested in motoring; motor cycles as well as cars claimed his attention, and for some time he used a B.S.A. machine.

A Miniature Runabout.

A well-known Midland firm is very seriously considering the addition of an ultra-light flat-twin two-stroke runabout to its range of productions. This vehicle is expected to turn the scales at less than the average 3½ h.p. sidecar outfit. Although up to now the heavy mortality of such designs in their teething stages is not encouraging, there is no doubt that an unlimited potential market awaits a really sound effort on these lines.

Export Credit Scheme.

The Federation of British Industries are suggesting to the President of the Board of Trade that the Treasury should provide for advances to approved firms of 100%, and not 80% as hitherto. The fundamental principle of the Treasury advancing 80% (for a period up to three years) of the cost price of goods to be supplied leaves 20% to be advanced by bankers of the manufacturing firm wishing to export. The Federation of British Industries consider that bankers are reluctant to advance this 20%.

1921 Automobile Design.

In *The Autocar* of October 30th the trend of automobile design in 1921 is shown graphically. Notwithstanding the evident influence of aero design on modern motor car engines, side-by-side valves remain standard practice on 75% of all the cars on the market. In gear boxes, another matter of interest to the motor cyclist, the battle between the three and the four-speed types does not appear to be decided yet, *The Autocar* statistics showing an almost dead heat in popularity. Clutches, too, show an amazing reluctance to settle down in the groove of one accepted design. The single-plate type (not yet prominent in the motor cycle field) tops the list by a short head from leather cone, multi-plate, and fabric cone. In fact, the automobile exhibits fewer signs of getting down to a basic common construction than does its humbler brother the motor cycle. Incidentally, this number of *The Autocar* contains a valuable load of information for those interested in the development of the motor car, and no doubt it will be retained by most of its readers as a means of reference.

As Usual.

New models for Olympia are rarely ready before the week preceding it. Despite the slackening off of work in the factories this year, makers seem in no better position than hitherto.

Pillion Riding.

Carriers are gradually being dropped by makers of American motor cycles. This, we understood, is due to the popularity of pillion seats with footrests, which are fitted by the owner who "scraps" the standard carrier.

A Weird Three-wheeler.

A strange looking three-wheeler has been evolved by F. C. Blake, of Kew Gardens. It has the single wheel at the front, and has the engine in front of the wheel; in fact, this part of the vehicle looks like the back part of a motor cycle. It is fitted with a 3 h.p. Dalm engine.

An Anniversary.

To-morrow's issue of *The Autocar* marks the completion of its twenty-five years' unbroken run as the leading journal devoted to the automobile. The largest, most successful, and having the largest circulation of the world's car journals, it is the parent of *The Motor Cycle*, which was born in 1903. Surely the offspring has a right to wish its progenitor many happy returns of the day—even in journalism? We do so with every sincerity, knowing how the example set by the parent journal has assisted to make *The Motor Cycle* what it is to-day.

Taxi-sidecars.

Bradford is the latest town to have sidecar taxis.

New Hudson Three-wheeler.

The latest entrant to the runabout field is New Hudson Ltd., who will exhibit their new model at Olympia.

A New Motor Attachment.

Economic Motors, Ltd., of Eynsford, Kent, are producing an auxiliary motor for pedal cycles. The engine is of 154 c.c. capacity.

Long Trip for Light Outfit.

On Tuesday, R. G. Mundy was booked to start from Holborn Viaduct at two o'clock, under A.C.U. observation, on a non-engine-stop run to Edinburgh, his machine being a 2¾ h.p. Coulson B and sidecar.

The Line of Demarcation.

Next year the 200 lb. limit for motor cycles to be taxed 30s. should automatically decide which machines are lightweights and which are not.

Brooklands in 1921.

In addition to the five large motor car races to be held at Brooklands during 1921, the following motor cycle fixtures, which are organised by the B.M.C.R.C., have also been arranged: Saturdays, April 16th, May 21st, and July 2nd; Wednesday, July 27th, Saturdays, August 27th, September 17th, and October 8th.

Open motor cycle meetings will be held on Saturdays, May 7th and August 6th.

One of the steepest grades (1 in 2⅞ maximum) in England. It is the "old" road to the Wyche cutting at Malvern, and the machine making the ascent is the 3 h.p. Ivy sidecar, which completed fifteen non-stop climbs under A.C.U. observation last Thursday.

IN SEARCH OF THE IDEAL DESIGN.

Extracts from a Paper and Discussion on the Springing of Motor Cycles, read before the Institution of Automobile Engineers.

IT is not generally known that during the war a great deal of experimentation took place in France in an endeavour to find a spring frame suitable for the conditions then prevailing.

On Thursday of last week, before members of the Institution of Automobile Engineers, at Birmingham, Sir Henry Fowler, K.B.E., presiding, Mr. G. H. Savage delivered a paper on the springing of motor cycles, which was based upon the author's experience in France while he was with the Mechanical Transport. This experience was unique, as it was the first time that the springing of motor cycles had been tested on a large scale.

The author endeavoured to show that spring frames were not only an advantage, but a necessity, and went into details showing the parts which suffer most in a rigid frame machine. These included head ball races, front forks, rims and spokes, wheel spindles, mudguards, carriers, carrier tool bags, lamps.

"An early test machine that came out from England," the author proceeded, "was a Douglas 2¾ h.p. rear spring model. It was fitted with two cantilever springs, one on each side of the rear wheel. The forward ends of the springs rested on a bracket about 8in. along the middle rail, the centre of the springs being hinged by the seat-pillar lug, and the rear ends shackled on to a stay that went over the wheel. The next experimental Douglas machines that came out were two 3½ h.p. machines, one fitted with rear springing; the machines came down to the Third Heavy Repair Shop from up the line, where they had evidently had hard work. Helical springs were fitted. The machine was good and very comfortable to ride, but the springs were too stiff to be responsive to the light shocks.

Various Practical Tests.

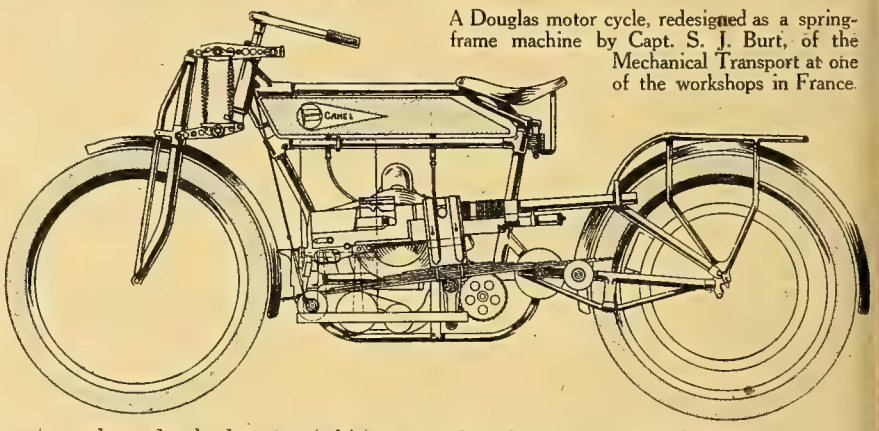
"Another spring frame machine to come out for test was the Royal Ruby. This machine had had some fairly severe work to do, but again it was impossible to say what mileage it had done. The only criticism was that the wheels were out of track a little. The springing was very comfortable, and the machine very much less tiring to ride than one with a solid frame.

"Of the machines built in France, the first was a Douglas 2¾ h.p. rear spring frame model designed by Capt. Francis and built at the 3rd Heavy Repair Shop. It had two leaf springs, one on each side of the rear wheel, level with the middle rail, the forward ends resting on a bracket bolted to the rail. The deflection from the normal, as far as the author can remember, was 3in. to 4in., and it was a very comfortable machine.

"Another design, which was got out by the author, was the fitting of rear springing to a standard Triumph machine. There was nothing particularly original about the design. The carrier and rear mudguard were unsprung.

"Another spring frame machine made in France was one designed by Capt. S. J. Burt of the 61 Aux. P. Coy., and some exceptional results were obtained with it. The machine was a standard Douglas 2¾ h.p., but different front fork springing was fitted, which gave much greater movement, and on the rear two cantilever leaf springs were fitted, one on each side of the wheel, also with a large range of movement.

"The relation of sprung to unsprung weight is an important point. Taking the instance of an unsprung car, its inertia would tend to keep it moving in a straight line, but if it meets an obstacle, the car must move out of this straight line, and this imposes a great strain on the tyres; if the car is sprung, however, only the inertia of the unsprung parts, axle and wheels, etc. (which are much lighter), has to be overcome, and the consequent stress is proportionately lower. On all vehicles that is the same.



A Douglas motor cycle, redesigned as a spring-frame machine by Capt. S. J. Burt, of the Mechanical Transport at one of the workshops in France.

The Effect of Wheel base.

"The makers of the Beardmore Precision inform the author that they have experimented with larger deflections than they at present allow on their standard spring frame machine, and have rejected them. They found that the movements were too great in their opinion for the short wheelbase of a motor cycle, and that the periods were too slow and the springs heavy. On their standard machines they allow a maximum movement of about 1½in. for the front wheel and 2in. for the back wheel, and this, in their experience, gives full relief from all road shocks.

"The Royal Ruby Cycle Co. say that their maximum allowable movements are about 3in. on front and rear wheels.

"The author has been informed by the makers of the Beardmore Precision that in their experience the steering is hardly affected by the large movements. This agrees with his own experiences on the 3rd Heavy Repair Shop spring frame Triumph machine already mentioned.

"With even the 2½in. to 3in. and 3½in. to 4½in. movement from the normal, there is no doubt in the author's opinion that a non-progressive action spring cannot be got to include the range of light and heavy shocks. The possible solutions of this difficulty are, first, a non-progressive action spring with a buffer; this, however, is not good, as it means that the heaviest shock is taken finally on the frame. The second is a laminated spring with supplementary springs, and this is a practicable solution. Care must be taken when designing the above to see that the supplementary springs are called upon to take direct thrust only.

"The third is springing with helical springs, where, as the main spring is compressed, other springs come into action; this is already used, but not with such large movements as are suggested here; the system has advantages but also many disadvantages. A helical spring in which the free height is approximately 3in. over the solid height, would require for the average weight machine to be about 12in. in length. This would have to be enclosed or to have a centre guide to prevent its buckling, and it would be somewhat difficult to fit in on the machine. On a design of this sort, with several long springs working in combination, care would have to be taken to see that the springs did not foul each other.

"With extension springs it would be difficult to work in a combination type, and the only suggestion is to change the action from the non-progressive type to a resultant action in which the load was no longer directly proportional to the deflection. This could be done without much difficulty by altering the leverage of the spring on the links as it was extended, or by increasing the rate at which it was extended for a given movement of the wheel. Experience has shown that in parallel wound extension springs, the safe value of the stress per square inch is only about two-thirds of that for compression springs of similar dimensions.

Volute Springs.

"A last alternative is the volute or conical spring, which can be made to practically any rate of progression, and it would seem to be worth while experimenting with this type. In one type of front fork, conical springs acting in compression are already fitted, but they are short and are only very slightly taper. A conical spring is not satisfactory when used in extension, as sufficient load to fully stress the smaller or stiffer coils cannot be applied without distorting the larger coils.

In Search of the Ideal Design.—

"It would be as well to compare the different designs of front forks, of which there seem to be three distinct types. The most usual is the parallel link motion type, where the links connect from the top of the front forks to the head of the frame, then the type as on the Triumph and the Beardmore Precision, where the front fork is hinged at the crown, and lastly, the design which seems to be popular on American machines, and which is also embodied in the Phelon and Moore front forks, where the connecting link comes straight off the wheel spindle.

"Rear springing on a motor cycle is a comparatively new feature, and it would be as well to regard it separately. The considerations in the design seem to be accessibility for viewing, repair and lubricating, and efficiency, cleanliness of design and cheapness; it would in fact be a compromise as usual. The maximum allowable movement from the normal should, the author thinks, be from 3½ to 4½in."

Mr. H. D. Teage *(The Motor Cycle)* was called upon to open the discussion, and mentioned that he had had excellent results from the 3½ h.p. spring frame Douglas mentioned by the author. Speaking as one who frequently followed trials over bad surfaces, he welcomed any improvement to motor cycle springing.

Saddle v. Frame Springing.

Mr. J. E. Greenwood followed, and pointed out that much experimental work was in progress. He spoke highly of the new Brooks leaf spring saddle, and stated that for passenger outfits he favoured a device of this description in conjunction with large tyres and a spring sidecar wheel in preference to a spring frame.

Maj. R. Vernon C. Brook pointed out that there were considerable difficulties to be overcome in design. He strongly recommended the use of steel head lugs, and also the use of a springing system which was adjustable to the weight of the rider.

Capt. Burt gave an interesting description of a 2¾ h.p. Douglas, for which he had designed a special springing system for war purposes. This machine performed some wonderful feats, and, amongst others, when loaded with a Hotchkiss gun and 360 rounds of ammunition, successfully negotiated a large diameter telegraph pole laid across its track, a petrol can, and a deep shell hole. The design of the machine can be followed from the appended drawing.

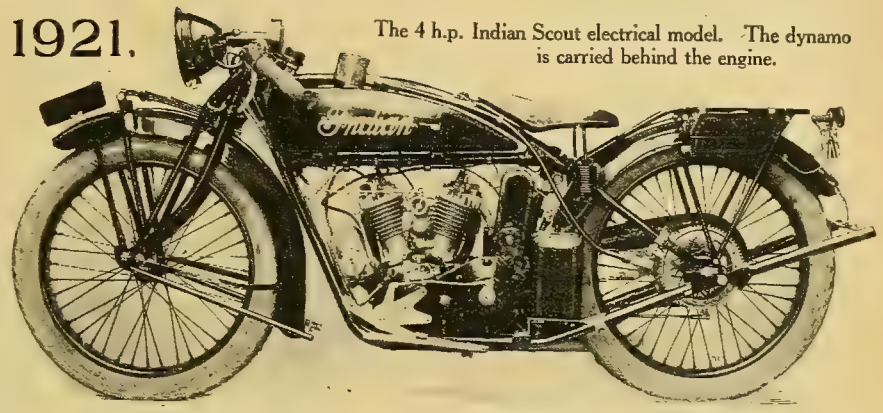
The discussion was then thrown open, and interesting points were raised by Messrs. Morgan, Pearsall, Higham, Chalmers, Holroyd, and Richardson.

Owing to the late hour, the discussion had to be curtailed, and the author was unable to reply. His reply will therefore be submitted in writing.

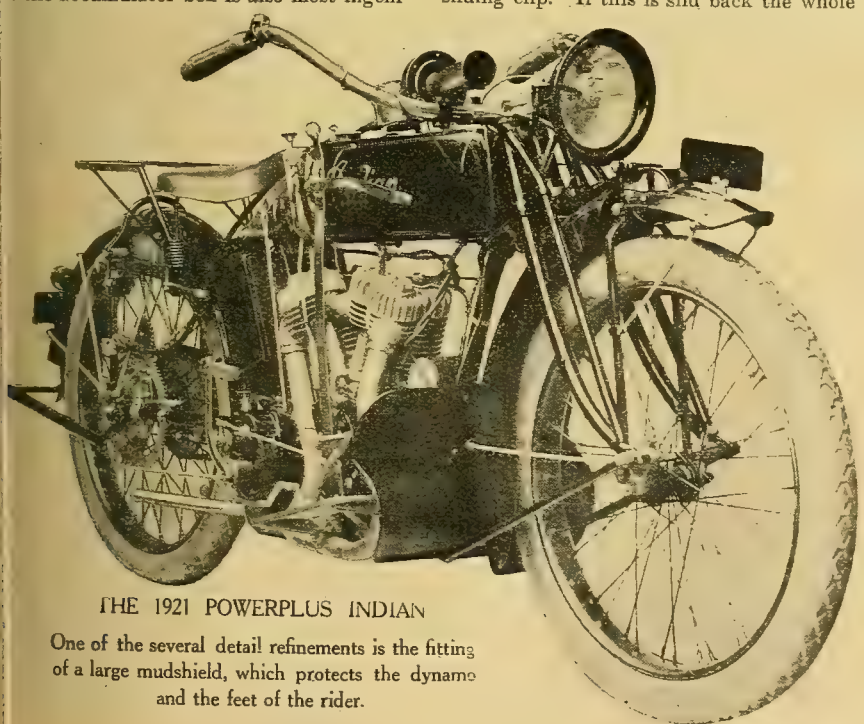
INDIANS FOR 1921.

Detail Alterations only, but very Complete Specifications for Both Models.

THE 4 h.p. Indian Scout has not undergone any revolutionary alterations for 1921, but the extremely practical way in which the Splitdorf dynamo is fitted and driven is well worthy of remark. The power from the engine is conveyed to the countershaft through gear wheels, which are entirely enclosed and running in oil. Forming part of this transmission are two additional wheels, also enclosed, and meshing with the larger wheel of the main transmission. On the shaft of the uppermost of these small gear wheels is fitted a pulley which drives the dynamo by means of a spring belt running in a neatly designed case. The fastening of the accumulator box is also most ingenious. A bracket similar in shape to a lamp bracket is clipped to the saddle tube, while on the near side chain stay is a sliding clip. If this is slid back the whole accumulator box may be quickly taken from the machine. The toolbox fitted is of metal, and is provided with a lock, while the 26in. × 3in. Goodyear tyres give the machine a substantial appearance.



The 4 h.p. Indian Scout electrical model. The dynamo is carried behind the engine.



THE 1921 POWERPLUS INDIAN

One of the several detail refinements is the fitting of a large mudshield, which protects the dynamo and the feet of the rider.

An Efficient Mudshield.

Like the Scout, the popular Powerplus model has not undergone many alterations for 1921. Formerly, wooden knobs were fitted to the change-speed and hand-controlled clutch, but these have been supplanted by aluminium knobs cast on to the levers, and there is now no possibility of their working loose. A noteworthy feature of this model is the large guard fitted to protect the dynamo from mud, the dynamo being driven by a spring belt off the engine-shaft. Naturally, the excellent spring frame and forks, which have been so successful for several seasons, are retained.

In the case of both models, the electrical equipment is somewhat similar, comprising head and tail lamps and an ammeter on the top tube. The Powerplus model is fitted with 28in. × 3in. tyres, and is, of course, ideal for sidecar work.

On our visit to the Indian depot we saw an interesting racing Indian which has just arrived from the United States for H. Le Vack, who will shortly go for some records with it. Apparently, the power unit is a standard Powerplus engine, but the frame is a special one with a large capacity tank, and many other interesting features.

The Possibilities of the Lightweight Sidecar Outfit.

Fifteen Non-stop Ascents of the Old Wyche by a 3 h.p. Ivy Two-stroke with Sidecar and Passenger.

WHEN shall we reach the limit of the small two-stroke machine is a question which well may be asked. Only a few weeks ago it seemed that a remarkable performance had been achieved when a 348 c.c. air-cooled two-stroke made twenty-five consecutive non-stop ascents of the Old Wyche at Malvern, but now we have to report a similar feat by the same machine, this time burdened with a sidecar and passenger.

Again, P. Newman was the demonstrator, and his 3 h.p. Ivy machine was equipped with a light Canoelet sidecar. A Sturmey three-speed gear box and all-chain transmission were used.

The test, which was carried out under A.C.U. observation, was timed for the forenoon of Thursday last, but the actual start was delayed until 12.37 owing to the dense mist which hung upon the hills.

With the regularity of a train, the little machine hummed round circuit after circuit, the engine apparently having ample power in hand.

Testing to the Limit.

After twelve ascents had been made, it was generally decided that no useful purpose would be served by carrying on, as the engine showed no signs of flagging, and apparently could have continued to run all day, so at the end of the fifteenth circuit, which was completed at 2.6 p.m., the driver was persuaded to stop with his engine still running, and an additional passenger was then taken upon the carrier.

Thus loaded, the machine made another, unfaltering ascent, and was again stopped and a heavier pillion passenger substituted. This time the engine emitted a loud knock as it breasted the 1 in 2⅞ portion of the hill, although it climbed well and came over the top without assistance.

The two final ascents (with three up), of course, were in the nature of an impromptu test, and were attempted merely to see what actually was the limit of the machine's powers; they showed that the outfit should answer every requirement of that large class which confines itself to main road touring.

The first fifteen ascents, however, which were officially observed, constitute a wonderful demonstration of the possibilities of the 3 h.p. Ivy as a light passenger machine, in which form it will be marketed during the year 1921.

In every way the engine was similar to the standard production which will be placed on the market after the Show. A two-lever Amac carburetter, Lodge plug, and E.I.C. magneto were fitted, while Shell spirit and Vacuum oil were used.

Half-way up the Old Wyche at Malvern; the gradient commences to stiffen at this point, and culminates in a short stretch of 1 in 2⅞. P. Newman made fifteen non-stop ascents on his 3 h.p. Ivy two-stroke with sidecar and passenger

"OPEN," "CLUB," AND "JOINT" COMPETITIONS.

IN the following letter to *The Motor Cycle*, the Secretary of the Auto Cycle Union draws attention to a point of interest to every club secretary:

"Sir,—Quite a number of complaints have been received during the past competition season by the Auto Cycle Union, not only that competitions which should be purely club events have been advertised as 'open,' but also from riders who, for various reasons, have been dissatisfied with the rulings of the judges when they have taken part in such events.

"Generally it is impossible to warn an hon. secretary in time to prevent his club infringing the open competition rules of the Auto Cycle Union, as in such cases it is usually through either the press, or a report from a dissatisfied competitor, that the Union obtains its information.

"I would hasten to say, however, that, in the opinion of my committee, such infringements are nearly always inadvertent, and arise through a lack of knowledge of the policy of the Union.

"The important thing seems to be that club committees, and motor cyclists in general, should realise the spirit of the competition rules, which have been framed in their own interests and in the interests of the sport as a whole.

"A club is at perfect liberty to promote any club competition for its members as it thinks fit; it can, moreover, if affiliated, combine with as many as four other affiliated clubs to run a joint *closed* competition. If a local centre of the Union has been formed in any district, then any number of clubs in that centre can combine for the purposes of a centre competition. If, however, any outsider or member of an unaffiliated club take part in any such competition, it ceases to be a closed competition and becomes an unauthorised 'open' one, and both promoters and participants render themselves liable to penalties. The reason for this is, of course, that the Union has no control over 'outsiders,' and, if they were guilty of any unsportsmanlike behaviour it could not penalise them.

"Recognising this, motor cyclists have formed a Union, one of the duties of which is, just as in other sports, to keep the sport clean. To carry out this duty means framing and enforcing certain regulations, which can only be effective if loyally observed by the great majority.

"T. W. LOUGHBOROUGH,
"Secretary Auto Cycle Union."

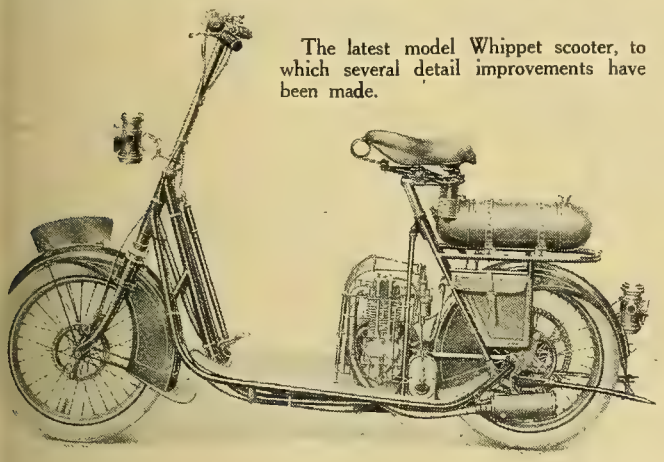
Whippet Scooter Modifications.

Detail Alterations only to a Remarkably Efficient 150 c.c. Overhead Valve Four-stroke.

CONSIDERABLE detail improvement has been incorporated in the latest model Whippet scooter, the novel design of which, it will be remembered, attracted much interest at the Motor Cycle Show last year.

The aluminium cylinder with detachable head and steel liner, the possibilities of which were, at first, criticised, have been retained. The aluminium piston, however, will be substituted at a later date, by a cast iron one. The existing piston has proved quite satisfactory in the hands of those who understand engines, but despite 7/1,000th of an inch clearance, bad handling and the lack of care exercised by the average purchaser have resulted in a few cases of seized engines.

In place of the decompressor originally fitted, a small cam, engaging beneath the exhaust rocker arm, provides a simple exhaust valve lifting mechanism.



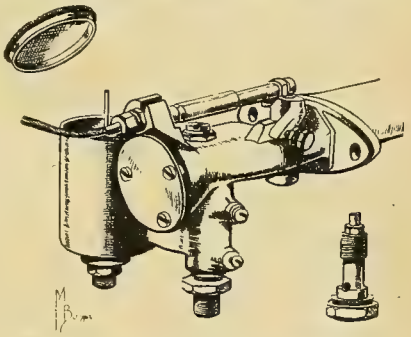
The latest model Whippet scooter, to which several detail improvements have been made.

A French Carburetter.

A new carburetter, the Vici, a French design, is now fitted, and is, the makers state, well suited for small engines of this type. As may be seen from the illustration, it is of the horizontal pattern, and is provided with a neat throttle adjustment. The main jet disposed beneath the mixing chamber is adjacent to the float chamber.

A small pilot jet, located between the main jet and the float chamber, is screwed in the top of the casting, and is fed from the channel between the float chamber and the main jet.

The air intake is protected by a circular plate held away from the casting by three distance pieces, through which the retaining pieces are placed. The two screws located in the jet chamber are merely to facilitate manufacture. The lower one, however, may be used for clearing the passage from the float chamber to the base of the main jet.



The Vici carburetter fitted to the Whippet scooter. Inset shows the main jet.

On our visit to the factory at Twickenham, we noticed a special model scooter used by the designer, Mr. Hayward, for experimental purposes, and during our brief run on this machine we were surprised at the power that was developed by so small an engine (150 c.c.)

The makers are Messrs. W. G. C. Hayward and Co., Ltd., Beaufort Works, Cambridge Park, Twickenham, Middlesex.

Through the Yorkshire Dales.

An Interesting Trial for Amateur Douglas Riders.

A NOVEL feature of the trial held on October 14th, and organised by Capt. Ellison Hawks, of the Douglas Depot, Harrogate, was that it was open only to amateur riders of Douglas motor cycles. The start was from Harrogate.

The first of the twenty-five competitors was timed away at 10.31. The route was by way of Ripley and Ripon to Masham, where was placed the first check. Then *via* Leyburn and Richmond to Darlington, where the machines were parked in the Market Square.

Failures on Clay Bank.

After the morning's easy task and an excellent lunch, the riders were in very good spirits, but the more knowing ones were not very optimistic in regard to the afternoon's programme, as they knew that the most strenuous part of the trial had yet to come. From Stokesley the route lay to Broughton, after which the first observed hill, Clay Bank, was encountered. The gradient of this hill is 1 in 8, increasing at the summit to 1 in 3.9, but the surface is excellent, with the exception of four "steps," which necessitate good driving and plenty of power to pick up after passing them. Most of the riders found it too much for their machines, however, which appeared generally to be overgeared. The best ascent was made by Richardson on a 2¾ machine, while Wildgoose made a fast climb on a 4 h.p. solo mount. Noble (aged fifteen), the youngest rider in the trial, made an excellent ascent, and nearly got up, but failed on the last rise, within a few yards of the top of the hill. Very good climbs were made by Sanderson (on a 4 h.p. sidecar outfit) and Walker.

The riders now wound their way between the hills and through Bilsdale, one of Yorkshire's most beautiful dales, passing through Chop Gate to Newgate Foot Hill, the second observed hill, where some exceptionally good ascents were made. The only failure on this hill was Addyman (1910 2¾ fixed gear). Illingworth made a very fast climb, as did Bever. Sanderson's sidecar put up a very good performance. White (4 h.p. sidecar outfit) broke his belt, but on restarting made a good climb. Clean ascents were made also by Hartley, Shanks, and H. J. Bankes, all on 2¾ h.p. machines.

The riders then continued past Rievaulx Abbey, and encountered Scawton Bank, the surface of which was in a very wet and greasy condition. Indeed, it was so bad that only two riders made clean ascents. These were White (4 h.p. sidecar) and Wildgoose (4 h.p. solo). Sanderson broke his belt near the top of the hill, and, in the opinion of the observers, would otherwise have made a clean ascent. The remainder of the riders again appeared overgeared. Leaving Scawton Bank and on to Hambleton the road was very bad in sections, owing to there having been a considerable amount of "logging." It was almost impossible to average 20 m.p.h. on this section until Sutton Bank was reached. Descending this hill most of the riders made up time along the dry level road to Thirsk, but the time lost by the majority of riders on Scawton Bank, and in the Hambleton section, showed itself at the Thirsk check.

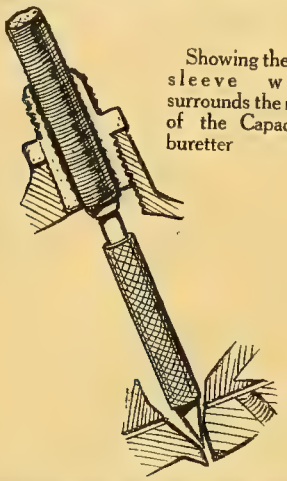
Many lose Time.

From Thirsk to Boroughbridge and Knaresborough the roads were excellent, and, had not the trial been run on the sectional basis, which proved so successful in this year's Scottish Six Days Trial, there is no doubt that most of the riders who were late at Thirsk would have made up their lost time by the time they reached the Knaresborough check.

The route covered approximately 125 miles, and, considering that this was their first experience of competition riding for practically all the entrants, the fact that nineteen out of twenty-five checked in at Harrogate must be regarded as very satisfactory.

A CAPAC IMPROVEMENT.

THE latest innovation on the Capac carburetter is a very simple but none the less effective one. It may be remembered that the Capac carburetter is provided with an adjustable needle controlling the jet opening. The improvement consists of a fine gauze sleeve surrounding the needle. The gauze becoming impregnated with petrol greatly facilitates the atomisation of the fuel, as the volatile portions thereof leave the gauze in the form of a mist, and not in globular form. There is less tendency



Showing the gauze sleeve which surrounds the needle of the Capac carburetter

to condensation in the induction pipe, consequently improved economy, acceleration and starting are the result.

It is also pointed out that with this device in use the engine will give its full power long before it is properly warmed up. The G vaporiser, as it is called, is said to improve acceleration particularly on such engines as V twins, where the induction pulsation is unequal.

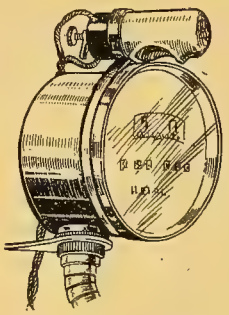
To fit the gauze is a very simple matter. The main jet needle unit must be removed completely by unscrewing the lower hexagon nut. If this is done, the jet setting will not be altered. When the gauze is slipped over, the unit can be replaced. Care must be taken to see that the gauze rests on the bottom portion of the well. When once the gauze has been fitted, it is usually advantageous to reduce the main jet needle opening slightly by screwing in the needle one-twentieth of a turn, and in most cases it is possible to reduce the by-pass opening by screwing in the by-pass screw.

The vaporiser is obtainable from the Capac Continental Co., Ltd., 2, Woodstock Street, London, W.1.

A cycle car at an acute angle. The G.N. shown here would be starved of petrol in this position with an ordinary carburetter fitted, but with a Capac using the G vaporiser perfect firing was obtained.

THE H.A.H. SPEEDOMETER LAMP.

AN exceedingly useful novelty has lately been brought out by Messrs. A. H. Hunt, Ltd., H.A.H. Works, Tunstall Road, East Croydon, Surrey. It consists of a speedometer lamp mounted on a spring clip to fit round the dial of the speedometer. The bulb may be had in any colour, but the sample submitted to us was blue. Now a blue light will not dazzle the rider, and yet will give sufficient illumination to read the figures on the speedometer dial. The idea is a particularly happy one. It is probably culled from the Navy, where blue lights are used on the bridge when the ship is darkened, as this particular colour can only be seen at a short distance.



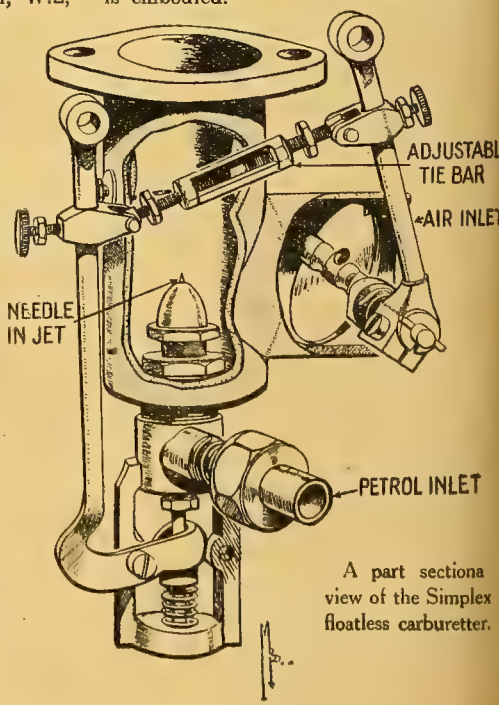
The H.A.H. speedometer lamp.

THE SIMPLEX FLOATLESS CARBURETTER.

THE new motor cycle carburetter which has been placed on the market by the Simplex Carburetter Co., 36a, Queen's Road, Bayswater, London, W.2, marks a somewhat startling innovation in motor cycle carburetion for the reason that no float chamber is fitted. Also there is no throttle, since the speed of the machine is controlled by raising or lowering a tapered needle running through the jet orifice, working in conjunction with a butterfly in the air inlet. Through the agency of an ingenious tie bar (by means of which the ratios between the two levers operating the jet needle and the air control are kept constant) the correct proportions of petrol and air may be obtained, while further adjustment can be effected by sliding two clamps, to which the tie-bar is attached. These adjustments naturally control the degree of, and time of, opening the butterfly in relation to the amount of petrol passing through the jet.

Above the jet is a choke tube. It will be noticed that petrol, instead of passing through a float chamber, is led directly to the base of the jet. When once the carburetter has been correctly set, and it is so set that the amount of air admitted for starting is very small, it is entirely automatic, and the opening of the air inlet is proportionate to the amount of petrol passing through the jet orifice.

We have not yet been able to test the carburetter on a motor cycle. We understand, however, that it gives great economy and a high degree of efficiency, while the slow running is entirely satisfactory.



A part sectional view of the Simplex floatless carburetter.

SIDECAR STEPS.

THE necessity or otherwise for a sidecar step is a matter for passengers to decide, but it is probably true that, if asked, the large majority would be in favour of such fitments. Those ladies who have been used to a footboard or step and return to a sidecar which is not so equipped almost invariably mention the inconvenience caused by its absence.

It is a little point, but one which should receive consideration on the part of sidecar manufacturers. In the meantime, Mr. H. F. Harrison, of 13, Styvechale Avenue, Coventry, has introduced a cast aluminium step which can be fitted conveniently to most chassis, and which may be purchased for 17s. 6d. At a slight extra charge a small electric lamp is embodied.

The Harrison sidecar step, which has split lugs for clipping on to the chassis. In one model a lamp is embodied in the lower half of the front lug.

Cycle Cars at the Car Show.

Thirteen Vehicles which may prove of Interest to Motor Cyclists.

SINCE the R.A.C. and A.C.U. decided that all four-wheeled motor vehicles are cars, the Motor Cycle Show at Olympia (November 29th to December 4th) will not include any examples of this interesting type of runabout, which is usually the motor cyclist's stepping-stone to larger cars.

At the Car Shows, commencing to-morrow (Friday) at Olympia and the White City, there will be many small four-wheelers. For the benefit of our readers who intend visiting either or both exhibitions, we append a list of the vehicles which may be regarded as being in the "cycle car" class, or of such a character as to embody certain features more or less common to motor cycle practice.

At Olympia.

BLERIOT WHIPPET. STAND 37.

As most readers are aware, this is an attractive little vehicle engined with a Blackburne 8 h.p. power unit, and has an ingenious system of variable gearing by means of a belt and expanding pulleys. The weight unladen is under 6 cwt.; the 1921 model has a hand lever starter operated from the driver's seat.

GRAHAME-WHITE. STAND 25.

A small cycle car fitted with a Coventry Victor air-cooled flat twin engine, and having friction transmission. A smaller model has all-chain transmission and a 350 c.c. Precision two-stroke power unit.

ROVER. STAND 57.

One of the most successful air-cooled vehicles of the year. It has a flat twin engine of 1,000 c.c., and three-speed and reverse gear box built integral, shaft transmission, and detachable disc wheels.

At the White City.

A.V. STAND 410.

Two types of this capable little cycle car will be exhibited, *i.e.*, single and two-seaters. In both cases the engines are J.A.P. twins, and a two-speed epicyclic gear is embodied.

CARDEN. STAND 476.

As the lowest-priced four-wheeler at present on the market, this cycle car is bound to create a great deal of interest. Its price is £100, the same as many lightweight motor cycles. A two-cylinder two-stroke engine is the power unit, and is integral with the gear box, which drives directly to the axle upon which the combined unit is carried.

CROUCH. STAND 439.

A twin-cylinder water-cooled engine and final chain drive are the main features of the Crouch, which has for many years proved a sturdy little vehicle at a popular price.

G.N. STAND 425.

Our readers require no introduction to this well-known cycle car. A 90° air-cooled twin engine and shaft-cum-chain transmission form part of its specification.

KINGSBURY JUNIOR. STAND 429.

A light car with a flat twin water-cooled engine and conventional shaft transmission, this vehicle is of interest to motor cyclists on account of its very moderate price.

L.M. STAND 332.

One of the earliest small four-wheelers, having a V twin water-cooled engine and chain transmission.

MAJOR. STAND 434.

The winner of the Grand Prix and fitted with a two-stroke engine having two cylinders and a common combustion head. Friction discs and final chain form its transmission system.

RICHARDSON. STAND 408.

Another friction-driven cycle car, of which a large number have been sold this year. It is fitted with a Jap or Precision air-cooled engine at option.

UNIT. STAND 333.

A newcomer with flat twin engine at the rear of the seats and final chain drive. Adjustable hammock seats are a feature.

TAMPLIN. STAND 433.

A cycle car well known to motor cyclists. It has an 8 h.p. Jap engine, Sturmey-Archer gear, and final belt drive.

Double Tickets.
